Specifically—2. In music: (a) A succession of tones, whether pleasing or not. In this sense melody is coördinate with harmony and rhythm as the three necessary constituents of all music. It depends essentially upon tones of relative pitch, successively arranged. (b) A series of tones so related to one another as to produce a distinct musical phrase or idea. The underlying relationship may be variously established: by any particular rhythmic arrangement, as in some popular dance-tunes; by the intervals of a single chord, as in arrangegio phrases; by a diatonic order, as in scale passages; by the harmonic connections between successive chords of which the melody in question forms one of the voice-parts, as in simple choral writing; and by innumerable melody
modifications and combinations of these and similar principles. (c) The principal voice-part in a harmonic composition; usually, now, the soprano, but in older music the tenor; the cantus firmus; the air. (d) A song of clear and balanced form; an air; a tune. A melody is authentic when its compass extends about an octave upward from its key-note or final, playal when its compass extends about a half-octave above and below the key-note and final. It is diatonic when it uses only the proper tones of the scale in which it is written, chromatic when it uses other tones, foreign to that scale. It is concrets or conjunct when it proceeds by single degrees, upward or downward; discrete or disjunct when it proceeds by steps of more than a single degree. It is spillable, when but on: tone is given to each syllable of the words; stured when more than one tone is given to a syllable. A melody may be further described as popular, national, artistic, etc.

3. A melodious or tuneful poem; a poetical composition suitable for singing.

1. A herbaceous succulent trailing annual plant. Curumis Melo. natural order Curumistacen. plant, Cucumis Melo, natural order Cucurbitaceæ, or its fruit, the muskmelon. The plant is not known in a wild state, but its origin was referred by De Candolle to the region of the southern Caspian. It has been cultivated from time immemorial in the hot countries of the East, the melons of Persia being specially celebrated, and is now planted wherever there is sufficient summer heat to mature its fruit. The latter at its best is very rich and highly flavored. It is an ellipsoid or globular pepo, the edible part of which is the inner layer of the pericarp, the stringy and watery placentse with the seeds being rejected. The melon is grown in numberless varieties, as the cantaloup, the nutmeg, etc. In the United States this fruit, in all its forms, is known as mushmelon—melon being applied indifferently to it and the watermelon, or even by preference to the latter. The melon of Numbers xi. 5 is thought by some to have been the watermelon (see def. 2). See cantaloup and Cucumis.

=Syn. To mollify, subdue; Melt, Dissolve, Thaw, Fruse.
Two words, ... popularly confounded, though scientifically very distinct, are melt and dissolve. The former signifies to bring a substance from a solid to a liquid condition by the agency of heat alone; the latter signifies the bringing about of this result by distributing the particles of the substance acted on among the particles of another substance which is itself liquid, and this process is termed the solution of the solid substance. Thaw differs from melt in being applicable only to substances whose ordinary condition is that of a liquid, and which have become solid in consequence of the abstraction of heat, and therefore return to the liquid condition as if of themselves. (Chamber's Journal.) Dissolve is much used as a synonymous with melt or thaw. Fuse is sometimes synonymous with melt (as, to fuse a wire by electricity), but it is more often used of melting together: as, bell-metal is made by fusing copper and tin. See the definitions of these words.

See divisive.=Syn. 1. Member, Limb. Limb is a precise term, in the human body applying to the arms and lega. We speak of the limb of a tree, but rarely apply limb to the leg of an animal. The word has little figurative use, except in science (see definition); such expressions as "limb of the law," for a lawyer, and "limb of the devil" for a rogue, are jocose, limb being used for member or part. Member is much freer in primary and in figurative uses for an integral or distinguishable part of a whole: as, a member of a sentence, of a family, of a society, of a state. It. membrana, \langle I. membrana, the skin or membrane that covers the several members of the body, the thin skin of plants, a skin parchment (<math>\rangle$  Gr.  $\mu\epsilon\mu\beta\rho\dot{\alpha}\nu a$ , parchment), cover, surface,  $\langle membrum$ , member: see member.] A thin plicible averaging structure of the body. A thin pliable expansive structure of the body; an expansion of any soft tissue or part in the form of a sheet or layer, investing or lining some other structure or connecting two or more structures. The term is used in the widest sense, with little or no reference to the kind of tissue which may be conlittle or no reference to the kind of tissue which may be concerned, the membranous quality depending upon thinness and pliability, not upon texture or fabric. No hard parts, as bone and cartilage, come within the definition of membrane. Most membranes are fibrous—that is, consist wholly or in part of some form of connective tissue, in or on which may be other and more special form-elements, as the layers of cells peculiar to the mucous, the serous, and other special membranes. In some cases a sheet of nerve-tissue, or of muscle-tissue, constitutes a membrane, with little admixture of other elements. Some membranes chiefly consist of a network of blood-ressels, with little connective tissue. Most membranes are specified by qualifying terms. See phrases following.

Memorial, Monument, Memento, Souvenir, and Memorandum agree in meaning that which puts one in mind or helps one to remember; all but memorandum are especially means of keeping a revered or endeared person, place, etc., in memory. A memorandum is simply a note made in order to prevent the forgetting of something important, especially something which might easily slip from the mind Memento and souvenir differ very slightly, souverir being a somewhat more elevated word: we give a book or a lock of hair as a memento; we prise a faded flower as a souvenir of a visit to Mount Vernon with friends now separated from us. Memorial and monument are sometimes the same: as, the Martyrs' Memorial at Oxford is essentially a monument. A monument is often a single shaft or column, as the Washington monument; a memorial may be a commemorative structure, an illuminated window, a book, etc. window, a book, etc.

Chauser, Prol. to Miller's Tale, l. 4.

=Syn. 1-4. Memory, Recollection, Remembrance, Reminiscence. Memory is the general word for the faculty or capacity itself; recollection and remembrance are different kinds of exercise of the faculty; reminiscence, also, is used for the exercise of the faculty, but less commonly, and then it stands for the least energetic use of it, the matter seeming rather to be suggested to the mind. The correctness of the use of memory for that which is remembered has been disputed. The others are freely used for that which is remembered. In either sense, recollection implies more effort, more detail, and more union of objects in wholes, than remembrance. Reminiscence is used chiefly of past events, rarely of thoughts, words, or scenes, while recollection is peculiarly appropriate for the act of recalling mental operations. See remember.

menhaden (men-hā'dn), n. [Also manhaden;
a corruption of Narragansett Indian munnauhatteaig (Roger Williams), lit. 'fertilizer,' a
name applied to the menhaden, herring, and alewife, all being used by the Indians for manuring
their corn-fields.] A clupeoid fish, Brevoortiu
tyrannus. It has the appearance of a shad, but is still
more compressed, has a large head, and the scales are
closely imbricated, leaving a high narrow surface exposed,
while their posterior margins are pectinated. The jaws and
mouth are toothless, and there is a deep median emargination of the upper jaw. The intestinal canal is very long,
and the chief food is obtained from mud taken into the
stomach. It is one of the most important economic fishes
of the eastern coast of the United States; it ranges from
25 to 45 north latitude, and in the summer occurs in the
coast-waters of all the Atlantic States from Maine to Florida, but in winter only south of Cape Hatteras. It is the
most abundant fish on the eastern coast of the United
States. Formerly it was used almost solely for manure,
but large quantities are now converted into oil, and many
are canned in oil, to be sold as "aardinea," like the European
fishes so named. It attains a length of from 12 to 16 inches, is bluish above with silvery or brassy sides, the fine usually tinged yellowish or greenish, and has a dark scapular blotch, often with smaller spots behind it. It varies
a good deal in details of form and color with age, and to
some extent with season and locality. This fish has at
least 30 different popular names in the United States, the
leading ones being mosbunker, with many variants (see
mosbunker), popic or popy and its variants, alengto or oidvie, whiting or whitejah, bony-fah, bughsh (which see),
hardhead, fatback, chebog, pulchan'd (a misnomer), schooly,

also in Africa and in regions of Asia, especially in the Khassian hills. They are very abundant in Brittany, France. They are usually tall and massive, either entirely rough or partly cut, and are set upright in or on the ground, either singly or in groups, alloments, circles, or other combinations. See megalithic.

All can trace back the history of the menhirs from his-toric Christian times to non-historic regions, when these rude stone pillars, with or without still ruder inscriptions, were gradually superseding the earthen tunuli sa record of the dead. Fergusson, Rude Stone Monuments, p. 60.

(μηνιγγ-), a membrane (see meniux), + -itis.] Inflammation of the membranes of the brain (μηνιγγ-), a membrane (see meniux), + -itis.] Inflammation of the membranes of the brain or spinal cord.— Epidemic cerebrospinal memingitis, an infectious disease which in ordinary cases is characterized by an acute invasion with violent headache, severe pains and stiffness in the neck, and great malaise, more or less fever, sometimes a chill, and sometimes vomiting. The subsequent course varies greatly, but usually presents severe headache and backache and retraction of the head, tenderness along the spine, often vertigo, stupor, frequently delirium, sometimes convulsions, sometimes vomiting, with paralysis of the ocular and facial muscles or abnormal stimulation of the same. The spinal nerves exhibit more or less disturbance; herpes facialis is frequent, and other skin affections, such as petechiæ, roseola, and urticaria. The spicen may be slightly but is not greatly enlarged. The disease lasts from two to four weeks in many cases, but it may be fatal in a few days, or a severe invasion may be followed by equally speedy recovery; on the other hand, it may last for eight weeks or more. It is most frequent in children, but adults are not exempt. The infection inheres in localities; proximity to or contact with the sick does not seem to increase exposure. Anatomically, the disease presents a purulent leptomeningitis of the cerebrospinal six. Also called black death, black fever, cerebrospinal fever, congestive fever, malignant meningitis, malignant purpura, malignant purpure fever, pertilential purpura, petechial fever, phrentite typhodes, purple fever, molted fever, typhoid meningitis, typhus spechalais, typhus sprocopalis.— Tubercular meningitis.

Menispermaceæ (men'i-spér-mā'sē-ē), n. pl.
[NL. (A. P. de Candolle, 1824), (Menispermum + -aceæ.] A natural order of dicotyledonous polypetalous plants, of which the genus Menispermum is the type, belonging to the cohort Ranales. It is characterized by small, usually three-parted, diocious flowers with the petals shorter than the sepals, and solitary seeds, which are attached by the ventral face, and have the micropyle above. The order embraces about 57 genera and 350 species, the number of which may, however. be greatly reduced; they are found principally within the tropics, although a few occur in North America, western Asia, and Australia. They are principally woody climbers, with alternate leaves and clusters of small flowers. The plants possess active narcotic and bitter properties, some being very poisonous, while others are used as tonics. It includes 4 tribes, the Timosporeæ, Cocculeæ, Cissampelidæe, and Pachygoneæ.

of the sixteenth century, and holds doctrines of the sixteenth century, and holds doctrines of which Menno Simons (1492-1559) was the of which Menno Simons (1492-1559) was the chief exponent. The leading features of the Mennonite bodies have been baptism on profession of faith, refusal of oaths, of civic offices, and of the support of the state in war, and a tendency to asceticism. Many of these beliefs and practices have been modified. The sect became divided in the seventeenth century into the Upland ("Obere") Mennonites or Ammanites and the Lowland ("Untere") Mennonites, the former being the more conservative and rigorous. Members of the sect are found in the Netherlands, Germany, Russia, etc., and especially in the United States. In the last-named country they are divided into "Untere" or Old Mennonites, "Obere" Mennonites or Ammanites, New Mennonites, for Mennonites, and Reformed Mennonites (or Herrians).

In music, noting that style of music which succeeded the earliest plain-song, and was distinguished from it by such a combination of simultaneous but independent voice-parts that a system of rhythm was necessitated to avoid a system of rhythm was necessitated to avoid confusion. It involved both a classification of rhythms and the invention of a notation to represent rhythmic values. Two principal rhythms were recognized: tempus perfectum, which was triple (called "perfect" for fanciful theological reasons), and tempus imperfectum, which was duple. The system of notation included notes and rests called large, maxima, long, breve, semibreve, minim, semiminna, fuse, and semitusa (fusella), of which in general each note was equal in duration to either three or two of the next denomination, according to the tempus used. (See the various words.) The working out of the system was highly complicated, but it prepared the way for the medieval study of counterpoint and for the invention of an adequate notation, and thus contributed directly to the progress of musical art. pseudoscinine passerine birds, represented by the genus Menura; the lyre-birds. It is one of two families (the other being Arichidae) which, though belonging to the order Passers, deviate from the normal passerine type in the structure of the vocal organs and in some other particulars, to such an extent that a separate division of the order has been established for their reception. (See Menuroidea and Pseudoscines.) The remarkable conformation of the tail of the male birds early attracted attention, and the size and general appearance of the birds caused them for many years to be considered as rasorial or gallinaceous, they being accordingly ranked with the mound-birds, curassows, and guans. Subsequently they were referred by some authors to the American family of rock-wrens (Pteroptochidae). It is only of late years that a knowledge of the anatomical structure has enabled ornithologists to classify the family correctly.

tis +-inc.] A subfamily of Mustelidæ peculiar to America, typified by the genus Mephitis; the skunks. The group is closely related to the badgers or Malina and to the African Zorillina, the three being combined by some authors. But the Mephitinæ are distinguished by having 2 or 4 more teeth in the lower than in the upper jaw, the back upper molar quadrate, and the premolars 3 above and below on each side (in one genus only 2 above on each side). The form is stout, with moderately developed limbs, unwebbed digits, and long bushy tail: the coloration is black and white; there is no subcaudal pouch as in badgers, but the perineal glands are enormously developed, secreting the fetid fluid which forms a means of defense and offense. The habits are terrestrial and to some extent fossorial. There are 3 genera, Mephitis, Spilogale, and Conepatus.

mephitis (mē-fi'tis), n. [\lambda L. mephitis, a pestilential exhalation; personified, Mephitis, also Mefitis, a goddess who averts pestilential exhalations.] 1. A pestilential exhalation, especially from the earth; any noxious or ill-smelling emanation, as from putrid or filthy substances; a noisome or poisonous stench.—2.

[ap.] [NL.] A genus of skunks, typical of the subfamily Mephitinæ. The teeth are 34 in number, 16 above and 18 below. The pelage is very long, the tail long and very bush, and the coloration black, striped or spotted with white. The palate ends opposite the last molar; the mastold process is flaring; the periotics are not much inflated; the zygoma rises backward; and the profile of the skull is highest over the orbits. The nostrils are lateral, and the soles hairy, at least in part. There are several species, of North and Central America, the best-known of which is M. mephitica, the common skunk. M. macrura is the long-tailed skunk of Mexico. The little striped skunk, M. putorius of the United States, is referred by Coues to the genus Spilogale. The South American and African skunks which have been referred to Mephitis belong to other genera. See skunk.

See law merchant, under law!.—Mercantile system, in polit. econ., the belief, generally held till the end of the last century, that all wealth consists in gold and silver, and that therefore the exportation of goods and importation of gold should be encouraged by the state, while the importation of goods and the exportation of gold should be forbidden, or at least restricted as much as possible.

While there are so many things to render the assumption which is the basis of the *inercantile system* plausible, there is also some small foundation in reason, though a very insufficient one, for the distinction which that system so emphatically draws between money and every other kind of valuable possession.

J. S. Mill, Pol. Econ., Prelim. Rem.

Thus, the Mercantile System admits every mode of applying the three factors of production, but considers them really productive only in so far as they increase the quantity of the precious metals possessed by the nation, either through the agency of mining at home or by means of foreign trade.

[< mercerize + -ation.] A process of treating cotton fiber or fabrics, invented by John Mercer, Lancashire calico-printer, and patented in a Lancashire calico-printer, and patented in 1851. He discovered that the steeping of cotton cloth from ten to twenty minutes in causatic and syrupy potash lye, and then washing out the cloth with alcohol of specific gravity 0.825, caused the texture to contract one tenth on drying, retaining 14.72 per cent. of potash. If sods lye of specific gravity 1.342 is substituted for the potash, the cloth shrinks one fourth and contains 9.68 per cent. of soda. Water abstracts all the soda, and leaves the shrunken tissue, which takes more brilliant colors in dyeing than unmercerized calico. Also spelled mercerization.

Merchant Adventurers. See adventurer.— Merchant bar, merchant iron, an iron bar which has been finished by passing through the merchant rolls. Puddied bars (see puddle) are worked into merchant iron or merchant bar by being cut into pieces of suitable length, which are then piled in packets, heated to a welding-heat, and then hammered and rolled, or rolled without hammering, into bars of suitable shape to be put upon the market. The amount of labor bestowed on this process depends on the quality of the iron it is desired to produce. Puddled bars which have been rolled a second time are called "No. 2," and this is what is usually designated as merchant bar. It is the lowest quality of iron available for the general smith's use. If piled and rolled again, the product is called "No. 3," Another repetition of the process furnishes an article known as "best-best," and still another gives "treblebest."— Merchant captain or seaman, a captain or seaman employed in the merchant service.— Merchant prince, a merchant of great wealth.

and was the herald and ambassador of Jupiter. As a
god of darkness, Mercury
is the tutelary deity of
thieves and tricksters; he
became also the protector
of herdsmen, and the god
of science, commerce, and
the arts and graces of life,
and the patron of travelers and athletes. It was he
who guided the shades of
the dead to their final abidfing-place. He is represented
in art as a young man, usually wearing a winged hat and
the talaria or winged sandals, and bearing the caduceus
or pastoral staff and often a purse.

5. The innermost planet of the solar system. Its mean distance from the sun is 0.387 that of the earth. The inclination (7 degrees) and the eccentricity (0.2069) of its orbit are exceeded only by some of the minor planets. Its diameter is only 3,000 miles, or about \$ of that of the earth; its volume is to that of the earth as 1 to 18.5. It performs its sidereal revolution in 88 days, its synodical in 116. Its proximity to the sun prevents its being often seen with the naked eye. The mass of Mercury, though as yet not very precisely determined, is less than that of any other planet (asteroids excepted). According to Schiaparelli it rotates on its axis in the same way as the moon does, once in each orbital revolution.

6. [l.c.] Chemical symbol, Hg; atomic weight, 200.1. A metal of a silver-white color and 6. [l. c.] Chemical symbol, Hg; atomic weight, 200.1. A metal of a silver-white color and brilliant metallic luster, unique in that it is fluid at ordinary temperatures. It becomes solid, or freezes, at about — 40°, and crystallizes in the isometric system. Its specific gravity at 0° is 18.6; when frozen, according to J. W. Mallet, 14.1932. This metal occurs native, sometimes in considerable quantity; but by far the largest supply is obtained from the sulphid, known as cinnabar. (See cinnabar.) Mercury is not very generally disseminated. In the United States only traces of its ores have been found to the east of the Cordillersa. The principal sources of supply are the mines of Almaden in Spain, of New Almaden and others near the Bay of San Francisco, and of Idria in Austria. Its chief use is in the metallurgic treatment of gold and silver ores by amalgamation. The thermometer and barometer are instruments in which the peculiar qualities of this metal are well illustrated. Commercially the most important salts of mercury are mercurous chlorid (HgCl<sub>2</sub>) or calomel, chiefly used in medicine, and the mercuric chlorid (HgCl<sub>2</sub>) or corrosive sublimate, a violent poison used in medicine and extensively in surgery as an antiesptic, and as a preservative in dressing skins, etc., being a very powerful antiseptic. The sulphid (HgS), or cinnabar, when prepared artificially, is called vermilion, and is used as a pigment. The names mercury and quicksilver are entirely synonymous, but the former is rather a scientific designation, and one necessarily used in compound names and in the adjective form; while the latter is a common popular designation of this metal. See amalgam, calomel, quicksilver.

The descending drops of mercury carry with them portions of the air or other gas from the receiver, and if the process is long continued, the supply vessel at the top being kept full, a nearly perfect vacuum may be obtained. This form of air-pump is often called a Sprengel pump. It gives a much higher degree of exhaustion than is possible with the ordinary mechanical air-pump, and is much used not only in physical experiments but also for practical purposes, for example in removing the air from the glass bulbs of the incandescent electric lamps.— Mount of Mercury, in palmistry.

of the genus Mergus or subfamily Merginæ, family Anatidæ; a sawbill, garbill, or fishing-duck.

Meriania

A merganser resembles a duck, but has a cylindrical instead of a depressed bill, with a hooked nall at the end, and a serration of very prominent back-set teeth. Reveral species are among the common water-fowls of the northern hemisphere. The common merganser or goosander, Mergus merganser or Merganser castor, is about 2 feet long, and nearly 3 in extent of wings. In the male the upper parts are glossyblack varied with white on the wings, the lower parts white tinged with salmon-color, the head and neck glossy darkgreen like a drake's and the bill and feet coral- or vermilionred. The head is slightly crested. The red-breasted merganser, M. servator, is a similar but somewhat smaller bird, with a reddish breast and the head more decidedly crested. The hooded merganser, Lophodytes cucultatus, is still smaller, black and white, with a beautiful erect semicircular crest. A South American species, distinct from any of the foregoing, is Mergus brasiliensis.

2. [cap.] A genus of Merginæ: same as Mergus.

merger<sup>1</sup> (mer'jer), n. [< merge + -er<sup>1</sup>.] One who or that which merges.
merger<sup>2</sup> (mer'jer), n. [< OF. merger, inf. as noun, a merging: see merge.] 1. In the law of conveyancing, the sinking or obliteration of a lesser estate in lands, etc., resulting when it is lesser estate in lands, etc., resulting when it is transferred without qualification to the owner of a greater estate in the same property (or the like transfer of the greater estate to the owner of the lesser), if there be no intermediate estate. At common law the lesser estate was not deemed to be added to the greater, but to be extinguished, so as to free the greater estate from the qualification or impairment which the existence of the lesser estate had constituted. Thus, if an owner of the fee of land on which there was an outstanding lesse, owned by another person, acquired the lesse, the lesse was thereby annulled, and he thereafter held simply as owner of the fee. It resulted sometimes that, if his title to the fee proved defective, he could not avail himself of any claim under the lesse.

mesmerical (mez-mer'i-kal), a. [< mesmeric + -al.] Same as mesmeric.
mesmerically (mez-mer'i-kal-i), adv. In a mes-

meric way; in the manner of or according to Mesmer or mesmerism; by mesmeric means. mesmerisation, mesmerise, etc. See mesmer

ization, etc.

mesmerism (mez'mer-izm), n. [(F. mesmerisme (Sp. Pg. It. mesmerismo); so called from Friedrich Anton (or Franz) Mesmer (1733-1815), a German physician, who propounded the theory in 1778, in Paris.] 1. The doctrine that one person can exercise influence over the will and persons extended on each produce. and nervous system of another, and produce certain phenomena by virtue of a supposed emanation, called animal magnetism, proceeding from him, or simply by the domination of his from him, or simply by the domination of his will over that of the person operated on. Originally Mesmer professed to produce his results by the operation of actual magnets, but all such apparatus has long been abandoned, and those who profess belief in magnetsm as the cause of the phenomena exhibited refer it to the body of the mesmerist. The actual phenomena believed to be produced by this so-called animal magnetism are now explained by modern hypnotism, or artificial somnambulism, which within recent years has been the subject of extended research. It is now generally admitted that there is no force of any kind transmitted from the operator to the person operated upon, and many of the pretensions of mesmerism, such as clairvoyance, are rejected. The term mesmerism is still popularly used, often more or less synonymously with hypnotism, but more frequently in its original or an allied sense. Other terms used more or less synonymously with the surgeon Braid, who first studied the phenomena of mesmerism scientifically) and neurohypnology.

By one of my usual processes for reducing the cataleptic state of muscles during hypnotism or memerism, I was enabled, in a few seconds, to unlock her jaws and open her mouth.

Braid, Trance, p. 59.

2. The influence itself; animal magnetism. mesmerist (mez'mer-ist), n. [<mesmer(ize)

The rigidity of the memerised fingers could be tested with, if possible, even more certainty than their insensibility, by simply telling the "subject," after a minute of meamerisation, to close his or her fist.

Proc. Soc. Psych. Research, I. 259.

mesmerizer (mez'mer-ī-zer), n. One who mesmerizes; a mesmerist. Also spelled mesmeriser.

mesmeromania (mez'mer-ō-mā'ni-ā), n. [<mesmer(ism) + mania.] Mesmerism regarded as a mania or delusion.

"The mesmero-mania," says one doctor in the Medico-Chirurgical Review, "has nearly dwindled in the metropolis into anile fatuity."

Mesne conveyance. See conseyance.— Mesne encumbrances, encumbrances the right of priority of which is intermediate to the dates of two other encumbrances or titles under consideration.— Mesne process, any process in a suit which intervenes between the original process of writ and the final execution.— Mesne profits, the profits of an estate which accrue to a tenant in possession intermediate between two dates, particularly the commencement and the termination of a possession held without right.

mesoarial (mes-ō-ā'ri-al), a. [< mesoarium +

-al.] Of or pertaining to the mesoarium. Encyc. Brit., XII. 660.

mesoarium (mes-φ-ā'ri-um), n.; pl. mesoaria (-ā). [NL., < Gr. μέσος + φάριον, dim. of φον, egg. Cf. mesovarium.] A fold of the peritoneum forming the mesentery of the overvor neum forming the mesentery of the ovary or genital gland of some animals, as fishes; a mesovarium.

The genital glands . . . overlie the kidneys . . . . each eing suspended by a fold of mesentery (mesoarium).

Huzley and Martin, Elementary Blology, p. 53.

mesoblast (mes' φ̄-blàst), n. [⟨ Gr. μέσος, middle, + βλαστός, a germ.] The middle one of the three germinal layers of any metazoic embryo, between the epiblast and the hypoblast; the mesoderm. It corresponds to the vascular layer of an earlier nomenclature, when the other two layers were called serous and mucous. By far the greater part of the body of a metazoic animal is derived from the mesoblastema (mes' φ̄-blas-tē' mä), n.; pl. mesoblastemata (-ma-tā). [NL., ⟨ Gr. μέσος, middle.]

blastemata (-ma-tä). [NL., < Gr. μέσος, middle, + βλάστημα, a shoot, a sprout: see blastema.] The mass or layer of cells which constitutes the mesoblast; the mesoderm in its early germina-

mesoblastemic (mes'ö-blas-tem'ik), a. [ \( mesoblastema + ic.] Of or pertaining to the meso-blastema: as, mesoblastemic cells or tissue.

blastema: as, mesoblastemic cells or tissue.

mesoblastic (mes-ō-blas'tik), a. [ $\langle$  mesoblast + ·ic.] Of or pertaining to the mesoblast: as, a mesoblastic cell; the mesoblastic layer.

mesobranchial (mes-ō-brang'ki-al), a. [ $\langle$  Gr.  $\mu$ έσος, middle, +  $\beta \rho$ άγχα, gills: see branchial.]

Overlying the middle of the branchial chambers: applied specifically to a median subdivision of the branchial region of the carapace of a crab called the mesobranchial labe. See

vision of the branchial region of the carapace of a crab, called the mesobranchial lobe. See cut under Brachyura.

mesocæcal (mes-ō-sō'kal), a. [⟨mesocæcum + -al.] Of or pertaining to the mesocæcum.

mesocæcum (mes-ō-sō'kum), n.; pl. mesocæcu (-kä). [NL., ⟨Gr. μέσος, middle, + NL. cæcum, q. v.] The mesentery of the cæcum and vermiform appendage; the special peritoneal fold which sometimes holds those parts in place.

mesocarp (mes'ō-kärp), n. [= F. mesocarpe; ⟨NL. mesocarpium, ⟨Gr. μέσος, middle, + καρπός, fruit.] In bot., the middle layer of a pericarp when it is possible to distinguish three dissimilar layers; the sarcocarp. It is the fleshy substance or edible part of fruits which lies between the epicarp and the endocarp. See cuts under drupe and endocarp.

Mesocarpaceæ (mes-ō-kär-pā'sē-ō), n. pl.

[NI., ⟨Mesocarpus + -aceæ.] One of the three

ramilies of algæ into which the group Conjugatæ is divided. The sexual reproduction is by a process of conjugation, which may be either scalariform (that is, between two or several cells of two different filaments) or lateral (that is, between two adjacent cells of the same filament). The result of this conjugation is the production of a globular zygosperm, which differs from that produced by the Zygnemacæ in that immediately after its formation it divides into two, three, or more cells, the central one only of which is fertile. Sometimes Mesocarpineæ. See Conjugatæ. families of algo into which the group Conju-

**Mesocarpus** (mes- $\bar{o}$ -kär'pus), n. [NL. (Hassall, 1845),  $\langle$  Gr.  $\mu\acute{e}\sigma o_{\zeta}$ , middle,  $+ \kappa a \rho \pi \delta_{\zeta}$ , fruit.] A genus of fresh-water algæ, typical of the family *Mesocarpaceæ*. The copulation is scalarform, and the spores are spherical or oval, between two cylindrical, straight, or alightly inbent cells.

straight, or sightly indent cells.

mesocephalic (mes- $\bar{0}$ -se-fal'ik or -sef'a-lik), a.

[ $\langle Gr. \mu i \sigma c, m i d d l e, + \kappa \epsilon \rho a \lambda h, h e a d, + -ic.$ ] 1.

In craniom., of medium size; neither large nor small; with a capacity of from 1,350 to 1,450 cubic centimeters.

A skull of variable form, mostly mesocephalic. W. H. Flower, Pop. Sci. Mo., XXVIII. 317.

2. Having a skull of medium breadth or ca-

mesocephalism (mes-ō-sef'a-lizm), n. [<meso-cephal-ic + -ism.] The character or state of being mesocephalic. Also mesocephaly.

Departures from a width of eight and length of ten mesocephalism), measured from one auricular aperture wer the head to the other, and nose root over the head to he nucha, determine whether the skull shall be considered long.

Amer. Nat., XXII. 614.

mesocephaly (mes-ō-sef'a-li), n. Same as meso-

chorus.] Same as corypnœus, 1.

mesocœlie (mes·ō-sēl), n. Same as mesocœlia.

mesocœlia (mes-ō-sē'li-ā), n.; pl. mesocœlia.

(-ē). [NL., < Gr. μέσος, middle, + κοιλία, a hollow, ventricle: see cœlia.] The ventricle of the mesencephalon; the mesencephalic cavity of the brain, connecting the diacœlia with the eniocelia: the squaduct of Sylvius. R. G. epicœlia; the aqueduct of Sylvius. B. G. Wilder.

mesocœlian (mes-ô-sê'li-an), a. [< mesocœlia + -an.] Of or pertaining to the mesocœlia of the brain.

Mesoccele tubular; mesoccelian roof quadrilobate.

Amer. Nat., XXI. 914.

mesocolic (mes-ō-kol'ik), a. [< mesocolon +
-ic.] Of or pertaining to the mesocolon: as,
a mesocolic peritoneal fold; mesocolic attachment

ment.

mesocolon (me-sok'ō-lon), n. [NL., < Gr. μεσόκολον, less prop. μεσόκωλον, the part of the mesentery next the colon, < μέσος, middle, + κόλον, the colon: see colon².] The mesentery of the colon: see colon². The mesentery of the colon in place.

mesocoracoid (mes-ō-kor'a-koid), a. and n. [< Gr. μέσος, middle, + E. coracoid.] I. a. Situated between the hypercoracoid and the hypocoracoid.

II. n. An element in the shoulder-girdle of teleost fishes, disintegrated from the coracoid or paraglenal cartilage, and intermediate between or bridging over the hypercoracoid and hypocoracoid. It is developed in the malacop-

hypocoracoid. It is developed in the malacopterygian and plectospondylous fishes, but is lost in the acanthopterygians.

mesocuneiform (mes- $\bar{0}$ -kū'n $\bar{e}$ -i-fôrm), n. and a. [ $\langle Gr. \mu \ell \sigma \sigma_c \rangle$ , middle. + E. cuneiform.] I. n. In an anat. and  $z \sigma \bar{o} l$ ., the middle one of the three cuneiform bones of the tarsus, lying between the ectocuneiform and the entocuneiform. It is in special relation with the head of the second metotarsal home. Also called mesocularity as a suborder of Bunotheria, having the incisors not growing from persistent pulps, the molars tubercular and never sectorial, the third trochanter apparently elevated, and the astragalus not grooved above. Ten Eocene genera are referred to this group. mesoduodenal (mes- $\bar{0}$ -dū- $\bar{0}$ -dē'nal), a. [ $\langle meso-duodenum + -al.$ ] Of or pertaining to the mesoduodenum.

metatarsal bone. Also called mesosphenoid.

II. a. Middle, as a cuneiform bone; pertain-

ing to the mesocuneiform.

mesode (mes'od), n. [ $\langle$  Gr.  $\mu\epsilon\sigma\omega\phi\delta\epsilon$ , a mesode (see def.),  $\langle$   $\mu\epsilon\sigma\sigma\epsilon$ , middle, +  $a\epsilon\epsilon\delta\epsilon\nu$ ,  $a\delta\epsilon\nu$ , sing,  $\rangle$   $\phi^{i}\dot{\eta}$ , a song, ode: see ode.] In anc. pros., a system of metrically different composition in-

tervening between a strophe and its antistrophe. See epode.

trophe. See epode. mesoderm (mes'o-derm), n. [ $\langle Gr. \mu \ell \sigma \sigma \rangle$ , middle,  $+ \delta \ell \rho \mu a$ , skin.] 1. The middle germinal layer of the three-layered embryo of any metazoic animal, lying between the endoderm and zoic animal, lying between the endoderm and the ectoderm. The term is used synonymously with mesoblast, the correlation being endoderm, mesoderm, and ectoderm; hypoblast, mesoblast, and epiblast; or mucous, vascular, and serous layers. Most of the body of every metazoan animal is derived from the mesoderm. When the embryo becomes four-layered, as it usually does, this state results from the splitting of the mesoderm into an inner visceral and an outer parietal layer, called respectively splanchnopleural and somatopleural, or involuntomotory and voluntomotory.

2. In hot, the middle layer of tissue in the shell

tory and voluntomotory.

2. In bot., the middle layer of tissue in the shell of the spore-case of an urn-moss.

mesodermal (mes o-der-mal), a. [< mesoderm + -al.] Of or pertaining to the mesoderm in plants or animals; having a middle germinal

Mesodermalia (mes'ō-der-mā'li-ā), n. pl. [NL., ⟨ Gr. μέσος, middle, + δέρμα, skin.] Spongiozoa or Porifera regarded as a prime division of the grade Cælentera, whose archenteron is a branching canal-system communicating with the outer water by a set of inhalent and exhalent pores; the sponges: opposed to Epithelaria, or all other collecterates collectively. R. von Lendenfeld.

mesodermalian (mes'ō-der-mā'li-an), a. and n. [< Mesodermalia + -an.] I. a. Pertaining to the Mesodermalia, or having their characters.

II. n. A member of the Mesodermalia.

mesocephalon (mes-ō-sef'a-lon), n.; pl. mesocephalo (-iā). [NL., ⟨Gr. μέσος, middle, + κεφαλή, head.] Same as mesencephalon.

mesocephalous (mes-ō-sef'a-lus), a. [⟨Gr. μέσος, middle, + κεφαλή, head, + -ous.] Mesocephalous (mes-ō-sef'a-lus), a. [⟨Gr. μέσος, middle, + κεφαλή, head, + -ous.] Mesocephalous (mes-ō-sef'a-lus), a. [⟨Gr. μέσος, middle, + κεφαλή, head, + -ous.] Mesocephalous (mes-ō-sef'a-lus), a. [⟨Gr. μέσος, middle, + κεφαλή, head, + -ous.] Mesocephalous (mes-ō-sef'a-lus), a. [⟨Gr. μέσος, middle, + κεφαλή, head, + -ous.] Mesocephalous (mes-ō-sef'a-lus), a. [⟨Gr. μέσος, middle, + κεφαλή, head, + -ous.] Mesocephalous (mes-ō-sef'a-lus), a. [⟨Gr. μέσος, middle, + κεφαλή, head, + -ous.] Mesocephalous (mes-ō-sef'a-lus), a. [⟨Gr. μέσος, middle, + κεφαλή, head, + -ous.] Mesocephalous (mes-ō-sef'a-lus), a. [⟨Gr. μέσος, middle, + κεφαλή, head, + -ous.] Mesocephalous (mes-ō-sef'a-lus), a. [⟨Gr. μέσος, middle, + κεφαλή, head, + -ous.] Mesocephalous (mes-ō-sef'a-lus), a. [⟨Gr. μέσος, middle, + κεφαλή, head, + -ous.] Mesocephalous (mes-ō-sef'a-lus), a. [⟨Gr. μέσος, middle, + κεφαλή, head, + -ous.]

And so form the foundation of the mesodermic investment by which the body cavity of the adult is lined.

mesochil (mes'ō-kil), n. [< NL. mesochilium, q. v.] Same as mesochilium (mes-ō-kil'i-um), n. [NL., < Gr. μέσος, middle, + λείλος, lip.] The intermediate part of the lip of such orchids as have this organ separated into three distinct parts. Lindley, Treasury of Botany.

mesochoros (me-sok'ō-ros), n. [⟨ Gr. μεσόχορος, standing in mid-chorus, ⟨μέσος, middle, + χορός, chorus.] Same as coryphœus, 1.

mesocœle (mes'ō-sē'l, n. Same as mesocœlia.
mesocœle (mes'ō-sē'li-ā), n.; pl. mesocœliæ in the Australian region.

in the Australian region.

Mesodeamidæ (mes-ō-des'mi-dē), n. pl. [NL.,

< Mesodesma + -idæ.] A family of bivalve mollusks, named from the genus Mesodesma. J. E. Gray, 1840. mesodic (me-

sod'ik), a. [< mesode + -ic.]

Donacilla chilensis, one of the desmida - right valve.

In anc. pros., constituting or pertaining to a colon, line, or system of a different length or metrical character interposed between two cola, two sets of uniform lines, or two systems of identical metrical form; especially, constituting, pertaining to, or containing a system of different form intervening between a strophe and its antistrophe. See epodic, palinodic, periodic,

proödic.

mesodont (mes'ō-dont), a. [⟨ Gr. μέσος, middle, + ὁδοίς (ὁδοντ-) = E. tooth.] 1. In anthropol., having medium-sized teeth: as, the mesodont races.—2. In zoöl., pertaining to the Mesodonta, or having their characters.

Mesodonta (mes-ō-don'tā), n. pl. [NL., ⟨ Gr. μέσος, middle, + ὁδοίς (ὁδοντ-) = E. tooth.] A group of extinct mammals of North America, resembling Insections a harmaterized by Copo

resembling Insectivora, characterized by Cope as a suborder of Bunotheria, having the incisors

mesoduodenum (mes-ō-dū-ō-dē'num), n. [NL., ⟨ Gr. μέσος, middle, + NL. duodenum, q. v.]
The fold of peritoneum which incloses and supports the duodenum; the duodenal mesentery.

g, a mesogaster (mes- $\bar{\phi}$ -gas'ter), n. [NL..  $\langle$  Gr. n.  $\mu\ell\sigma\sigma\sigma$ , middle,  $+ \gamma a\sigma\tau\ell\rho$ , belly.] 1. An inter-

mediate part of the intestine, extending from mediate part of the intestine, extending from the pylorus to the execum, and including the small intestine with its annexes, as the liver and pancreas, also, in the fetus, the umbilical vesicle. It is commonly called the mid-gut.—
2. [cap.] A genus of fossil fishes. Agassiz.

mesogastral (mes-ō-gas'tral), a. [< mesogaster + al.] Of or pertaining to the mesogaster.

mesogastric (mes-ō-gas'trik), a. [< mesogastrium + ic.] 1. Of or pertaining to the mesogastrium; umbilical, as a region of the abdomen; mesenteric with reference to the stomach

men; mesenteric with reference to the stomach or to the mesogaster.—2. In Crustacea, situated in the middle of the gastric lobe of the carapace: specifically applied to a median subdivision of that lobe, the mesogastric lobe. See cut under Brachyura.

Magaggastrium (mesogastrium) n. [NI. 6]

mesogastrium (mes-ō-gas'tri-um), n. [NL., ζ Gr. μέσος, middle, + γαστήρ, belly.] 1. In human anat., the umbilical region of the abdomen, between the epigastrium above and the hypogastrium or epigubic region below. See cut under abdomen.—2. In anat. and zoöl., the mesentery of the stomach; the fold of peritoneum which holds the stomach in place. It is a portion of the common intestinal mesentery, in early fetal life indistinguishable therefrom, but afterward variously modified.

mesogenous (me-soj'e-nus), a. [ζ Gr. μέσος, middle, + -γενης, born, produced: see-genous.] Increasing by growth at or from the middle, as the spores of certain fungi. [Rare.]
mesoglæa (mes-ō-glē'ġ), n. [NL., ζ Gr. μέσος, middle, + γλοία, γλοιά, glue: see glue.] 1. The mesodermal intercellular substance, or ground-substance, or ground-substance, or ground-substance.

substance, of some animals, as sponges and other coelenterates. R. von Lendenfeld, Proc. other cœlenterates. R. von Lendenfeld, Proc. Zoöl. Soc., London, 1886, p. 566.—2. [cap.] A genus of gelatinous seaweeds, typical of the Mesoglæacea, with olive-brown branching filiform fronds. The unilocular sporangia are oval in shape and borne at the base of peripheral filaments; the plurilocular sporangia are unknown. Agardh, 1817.

Mesoglæaceæ (mes'ō-glē-ā'sē-ē), n. pl. [NL. (Kuetzing, 1843), < Mesoglæa + -aceæ.] A family of olive-green seaweeds with a gelatinous or cartilaginous thallus of hemispherical or cylindrical outline, forming small gelatinous or slimy.

drical outline, forming small gelatinous or slimy cushions or branching tutts on other larger seaweeds: the same or nearly the same as the Cherdaries or Chordariaces of Harvey. See Chordariea.

mesoglæal (mes-ō-glē'al), a. [< mesoglæa + Consisting of, pertaining to, or resembling mesoglæa.

mesoglutæus (mes "ō-glö-tē 'us), n.; pl. mesoglutæi (-ī). [NL., \( \text{Gr. \$\text{\$\text{\$\sigma}\$}}\), middle, \( + \text{NL. glutæus}, \) q. v.] The middle gluteal muscle; the glutæus

mesogluteal (mes'ō-glō-tē'al), a. [< mesoglutæus + -al.] Of or pertaining to the mesoglutæus.

mesognathic (mes-og-nath'ik), a. Same as mesoanathous.

mesognathous (me-sog'nā-thus), a. [ζ Gr. μίσος, middle, + γνάθος, jaw.] 1. Having a moderate or intermediate gnathic index of from 98 to 103, as a skull.—2. Having a skull thus

characterized, as a person.

mesognathy (me-sog'nā-thi), n. [As mesognathous + -y.] That character of a skull or person ous + -y.] That character of a skull or person in which the jaws are moderately prominent anteriorly, indicated by a gnathic index of from 98 to 103.

Mesohippus (mes- $\bar{\phi}$ -hip'us), n. [NL.,  $\langle$  Gr.  $\mu\ell\sigma\sigma$ , middle,  $+i\pi\pi\sigma$ , a horse.] A genus of very small three-toed horses, of the family Equidx, founded by Marsh in 1875 upon remains from the early Miocene of North America. The animal was only about as large as a sheep, with three func-tional digits on each foot, and an additional splint-bone on each of the fore feet.

mesolabe (mes [5-lāb), n. [< L. mesolabium, < Gr. "μεσολάβιον, prop. μεσόλαβιον, μεσόλαβος, an instrument invented by Eratosthenes for finding mean proportional lines,  $\langle \mu i \sigma \sigma_c$ , middle, mean (neut. pl.  $\mu i \sigma \sigma_c$ , mean terms),  $+ \lambda a \mu \beta \dot{a} v \epsilon v$ ,  $\checkmark \lambda a \beta$ , take. Cf. astrolabe.] A mechanical contrivance take. Cf. astrolabe.] A mechanical contrivance for geometrically extracting the roots of quantities. It consists of a number of equal rectangles, each having a diagonal marked, and all capable of sliding along a line common to the bases of all, so that they partially overlap one another. The marked diagonals are all parallel. To use the instrument, all the intersections, each formed of the diagonal of one rectangle and the overlapping edge of the next one, are brought, by the sliding along of the rectangles, into one straight line with one extremity of the diagonal of the uppermost rectangle and a point on the exposed edge of the lowermost whose distance from the extremity of the diagonal on the same edge measures the quantity whose root is to be extracted. Then the corresponding distance on the uppermost rectangle is the root multiplied by that of the common altitude of the rectangles, which last is supposed to be known. The exponent of the root is equal to the number of rectangles employed. The mesolabe was invented by Eratosthenes, about 200 to 250 years before Christ.

mesole (mes  $\bar{o}$ ), n. [ $\langle$  Gr.  $\mu\ell\sigma\sigma_{\zeta}$ , middle ( $\uparrow$ ).]

The mesonephric tubules extend gradually from behind forwards till they come in contact with the pronephros.

See thomsonite.

mesolite (mes' $\bar{\phi}$ -līt), n. [ $\langle Gr. \mu \ell \sigma \sigma_{\zeta}, \text{middle}, + \lambda \ell$ -

mesolite (mes'ō-līt), n. [⟨Gr. μέσος, middle, + λί-θος, stone.] A zeolitic mineral resembling scole-cite, but containing both calcium and sodium. mesolobar (mes'ō-lō-bār), a. [⟨ mesolobe + -ar².] Of or pertaining to the mesolobe; cal-losal: as, mesolobar arteries. [Rare.] mesolobe (mes'ō-lōb), n. [⟨Gr. μέσος, middle, + λοβός, lobe: see lobe.] The callosum or corpus callosum of the brain; the great com-missure of the carebral hemispheres. [Rare.]

missure of the cerebral hemispheres. [Rare

missure of the cerebral nemispheres. [Livate or obsolete.]

mesologarithm (mes-ō-log'a-riThm), n. [(Gr. µέσος, middle, + E. logarithm.] A logarithm of the cosine or cotangent. Kepler.

mesological (mes-ō-loj'i-kal), a. [(mesolog-y + -ic-al.]) Of or pertaining to mesology; relating to the medium in which an organism exists.

Grapes contain the mineral salts in variable quantity, the proportion depending on the variety of grape and on mesological conditions.

Buck's Handbook of Med. Sciences, III. 882.

mesology (me-sol'ō-ji), n. [⟨Gr. μέσος, middle, + -λογία, ⟨λέγειν, speak: see -ology.] The sum of human knowledge concerning the relations of an organism to its environment.

mesomeristem (mes-ō-mer'is-tem), n. [⟨Gr. μέσος, middle, + E. meristem.] The innermost of the two layers into which the exomeristem is divided. The exomeristem is the thickenter also which

divided. The exomeristem is the thickening-ring which surrounds the axial strand (primary pith of Sanio) or pith-cylinder of the nascent shoots or branches of plants. It is divided into two layers, the mesomeristem, which gives rise to the vascular bundles, and the perimeristem, which gives rise to the external cortex and the dermatogen.

neum.

mesometritis (mes'ō-mē-trī'tis), n. [NL., ⟨Gr. μέσος, middle, + μήτρα, the womb, + itis.] In pathol., inflammation of the middle or museular coat of the uterus. Compare metritis.

mesometrium (mes-ō-mē'trī-um), n.; pl. mesometria (-ā). Same as mesometry.

mesometry (mes'ō-mē-trī), n.; pl. mesometries (-trīz). [⟨NL. mesometrium, ⟨Gr. μέσος, middle, intermediate, + μήτρα, the womb: see matrix.]

The mesentery of the womb or its annexes; a peritoneal fold, holding in place the uterus or an oviduct. The broad ligament of the human uterus is an oviduct. The broad ligament of the human uterus is a mesometry. Corresponding duplications of peritoneum acquire special characters in different cases.

acquire special characters in different cases.

It [the oviduct of a bird] is supported by peritoneal folds forming a mesometry, like the mesentery of the intestines.

Mesomphalia (mes-om-fā'li-ā), n. [NL. (Hope, 1838), Gr. μέσος, middle, + ὁμφαλός, the navel.]

A genus of beetles of the family Chrysomelidæ. They are almost exclusively South American, there being over 200 such species, as against one in North America. M. conspersa is a South American species with peaked elytra, of a blackish-green color punctured with velvety black spots, and burnished with six larger golden-haired spots.

spots. **Mesomyodi** (mes″ō-mī-ō'dī), n. pl. [NL.,  $\langle$  Gr.  $\mu\ell\sigma\sigma_{\zeta}$ , middle,  $+\mu\bar{\nu}_{\zeta}$ , musele,  $+\dot{\omega}\delta\bar{\eta}$ , song.] A suborder or other prime division of *Passeres*, in which the syrinx is mesomyodian; non-melodious or songless passerine birds: distinguished from Acromyodi.

mesomyodian (mes'ō-mī-ō'di-an), a. [As Mesomyodi + -ian.] Having the intrinsic syringeal muscles attached to the middle part of the upper bronchial rings.

Syrinx with less than four distinct pairs of intrinsic muscles inserted at the middle of the upper bronchial half-ring, representing the mesomyodian type of voice-organ.

Coucs, Key to N. A. Birda, p. 427.

Couss, Key to N. A. Birds, p. 427.

mesomyodous (mes'ō-mī-ō'dus), a. [As Mesomyodi + -ous.] Same as mesomyodian.

meson (mes'on), n. [< Gr. µέσον, the middle, neut. of µέσος = L. medius, middle: see medium, midl.] 1. The median plane which divides a body into two equal and symmetrical parts; the vertical longitudinal middle plane, dividing the body into right and left halves. Every median line lies in the meson. The dorsal border of the meson is called the dorsimeson; the ventral, ventrimeson. Also mesium. See median!, a.

The meson mesal or median plane is an investionary longer.

The meson, mesal, or median plane is an imaginary longitudinal plane extending from the dorsal surface of the body to the ventral surface, and dividing the body into right and left symmetrical halves.

The mesonephric tubules extend gradually from behind forwards till they come in contact with the pronephros.

Micros. Science, XXIX. 136.

mesonephron (mes-ō-nef'ron), n.; pl. mesonephra (-rā). [NL., ζ Gr. μέσος, middle, + νεφρός, kidney: see nephritis.] The Wolffian body proper; the central or intermediate part of the segmental organs or primitive renal organs of the embryo, between the pronephron and the metanephron, whose duct is the Wolffian duct: distinguished from pronephron and metaneph-

ron.

mesonephros (mes-ō-nef'ros), n.; pl. mesonephros (-roi). [NL.: see mesonephron.] Same as mesonephron. Gray, Anat. (ed. 1887), p. 133.

mesonotal (mes-ō-nō'tal), a. [⟨ mesonotum + -al.] Situated on the mesonotum; of or pertaining to the mesonotum.

mesonotum (mes-ō-nō'tum), n. [NL., ⟨ Gr. μέσος, middle, + νῶτος, the back.] The middle one of the three divisions of the notum of an insect, succeeding the proportum and preceding insect, succeeding the pronotum and preceding the metanotum; the dorsal division of the mesothorax; the upper part of the middle thoracic thorax; the upper part of the middle thoracic segment. It consists typically of four sclerites, called prosecutum, scutellum, and postscutellum, which may or may not be distinguishable by means of sutures between them. In Hymenoptera, Lepidoptera, and Diptera it is very large, forming the principal part of the upper surface of the thorax: in these insects its divisions are usually named without the prefix meso. In insects having wing-covers the mesonotum is generally concealed by them, except a place called the scutellum, which may be very small, as in most Coleoptera, or large, as in many Hemiptera.

Mesonychidæ (mess-ö-nik'i-dē), n. pl. [NL., < Mesonyx + idæ.] A family of mammals having as type the genus Mesonyx.

to the vascular bundles, and the perimeristem, which gives rise to the external cortex and the dermatogen.

mesometric (mes-ō-met'rik), a. [\(\sim \text{mesometry}\) mesometry (mes-ō-niks), n. [NL., \(\sim \text{Gr. μέσος,}\) middle, \(\delta v \text{vξ (ovvχ-), nail: see onyx.}\) A genus mesometrium: as, mesometric folds of peritoin 1873 upon remains from the Eocene beds of Wyoming. It represents a generalized type supposed by Cope to have some relationship with existing seals. The animal had flat blunt claws and a long slender tail.

mesoparapteral (mes " $\tilde{v}$  -pa-rap'te-ral), a. [(mesoparapter-on + -al.] Of or pertaining to the mesoparapteron.

the mesoparapteron.

mesoparapteron (mes'ō-pa-rap'te-ron), n.; pl.

mesoparaptera (-rš). [NL.,  $\langle$  Gr.  $\mu\acute{e}\sigma c$ , middle,

+ NL. parapteron: see parapteron.] The pa
rapteron of the mesothoracic segment; the

third sclerite of the mesopleuron.

mesophlebitis (mes'ō-flē-bī'tis), n. [NL.,  $\langle$  Gr.  $\mu\acute{e}\sigma c$ , middle,  $+\phi \lambda \acute{e}\psi$  ( $\phi \lambda \acute{e}\beta$ -), a vein, + -itis.]

In pathol., inflammation of the middle coat of

mesophlœum (mes-ō-fiē'um), n. [NL., < Gr. μέσος, middle, + φλοιός, bark.] In bot., the middle or green layer of bark.

mesophragm (mes'o-fram), n. [NL.: see meso-phragma.] Same as mesophragma.

mesophragma (mes-ō-frag'mā), n.; pl. mesophragma (mes-ō-frag'mā), n.; pl. mesophragma (Gr. μέσος, middle, + φράγμα, partition: see diaphragm.] 1. In entom., a transverse internal partition, descending from the anterior border of the metathorax above, between the mesophragma. thorax and the metathorax, and serving for the attachment of muscles. It probably corresponds to the metapræscutum; it is often absent.—2. In Crustacea, that process of an endosternite (or intersternal apodeme) which is directed inward to unite with its fellow and form an arch over the sternal canal. See ster-

nal canal, under sternal canal. See sternal canal, under sternal, mesophragmal (mes-ō-frag'mal), a. [< mesophragm+-al.] Pertaining to the mesophragm. mesophyl, mesophyll (mes'ō-fil), n. [NL., < Gr. μέσος, middle, + φίλλον, a leaf.] The parenchymatous tissue which lies between the epideminal larges of a flat leaf larges; the soft dermal layers of a flat leaf-lamina; the soft

inner tissue of leaves.

mesophyllum (mes-ō-fil'um), n. [NL., < Gr.
μέσος, middle, + φίλλον, leaf.] Same as mesophyl. [NL., < Gr.

mesophytum (me-sof'i-tum), n.; pl. mesophyta (-tā). [NL., ζ Gr. μέσος, middle, + φυτόν, a plant.] In bot., the line of demarcation be-tween the internode and the petiole. Lind-

mesopic (me-sop'ik), a. [ $\langle Gr. μ t σ σ \rangle$ , middle, + ω ψ (ωπ -) face.] Having a nasomalar index of from 107.5 to 110, as the negroid races; having small and moderately retreating malar bones: as, a mesopic face.

mesoplast (mes'ō-plast), n. [ Gr. μέσος, middle, + πλαστός, verbal adj. of πλασσειν, form, mold.] \*\*Mesoplastic (mes-φ-plas'tik), a. [< mesoplastic (mes-φ-plas'tik), a. [< mesoplast + -ic.] Of or pertaining to mesoplast. mesoplastral (mes-φ-plas'tral), a. [< mesoplastran + -al.] Of or pertaining to the mesoplastran + -al.] Of or pertaining to the mesoplastran + -al.]

In the Pleurodira the first two families are distinguished from one another by the presence or absence of a mesoplatral bone.

Nature, XL 7.

mesoplastron (mes-φ-plas'tron), n. [ Gr. μέσος, middle, + E. plastron.] A median and ante-rior bone or plate of the plastron developed in

certain of the pleurodirous tortoises.

mesopleural (mes-ō-plö'ral), a. [(mesopleuron + -al.] In entom., intermediate and lateral, as a part of the mesothorax; of or pertaining to the mesopleuron.

mesopleuron (mes-ō-plö'ron), n.; pl. mesopleura (-rā). [NL., < Gr. μέσος, middle, + πλευρόν, a rib: see pleura.] The lateral or pleural part of the mesothorax of an insect; a mesothoracic pleuron, following the propleuron and preced-

petron, tonowing the propletron and preceding the metapleuron. Each mesopleuron, right and left, is divided into three scierites—an episternum, an epimeron, and a parapteron.

Mesoplodon (me-sop'lō-don), n. [NL.,  $\langle$  Gr.  $\mu\ell\sigma\sigma$ , middle,  $+\delta\pi\lambda a$ , arms,  $+\delta\sigma\sigma$  ( $\delta\sigma\sigma$ ) = E. tooth.] A genus of cetaceans: same as Zinhius phius.

phius.

mesoplodont (me-sop'lō-dont), a. [< Mesoplodont(t-).] Armed with a tooth in the middle of each side of the lower jaw: said specifically of whales of the genus Mesoplodon.

mesopodia, n. Plural of mesopodium.

mesopodial (mes-ō-pō'di-al), a. and n. [< mesopodium + -al.] I. a. 1. Of or pertaining to the mesopodium of a mollusk.—2. Of or pertaining to the mesopodialia.

taining to the mesopodialia.

II. n. A mesopodial bone; one of the meso-

nodialia

mesopodialia (mes-ō-pō-di-ā'li-ā), n. pl. [NL. (Marsh, 1880): see mesopodium.] The bones of the carpus and tarsus, taken together, as mutually corresponding, and as forming morphological segments of the limbs intervening between the epipodialia and the metapodialia. See epipodialia.

See epipodata.

mesopodium (mes- $\bar{0}$ -p $\bar{0}$ 'di-um), n.; pl. mesopodia (- $\bar{a}$ ). [NL.,  $\zeta$ Gr.  $\mu$ foo, middle,  $+ \pi$ oo  $(\pi$ o $\bar{0}$ ) = E. foot.] The middle one of the three parts into which the foot of some mollusks, as gastropods and pteropods, may be divided, between the propodium and the metapodium. See epipodium

mesopostscutellar (mes'ō-post-skū'te-lär), a. [<mesopostscutellum + -ar3.] Of or pertaining to the mesopostscutellum.

mesopostscutellum (mes-φ-post-skū-tel'um),
n.; pl. mesopostscutella (-ä). [NL., ζ Gr. μέσος,
middle, + NL. postscutellum, q. v.] The postscutellum of the mesonotum; the postscutellar

scutelium of the mesonotum; the postscutellar sclerite of the mesothorax.

Mesopotamian (mes 'ō-pō-tā' mi-an), a. [<br/>
Mesopotamia, < Gr. Μεσοποταμία, Mesopotamia (see def.), lit. 'the land between the rivers,' <br/>
μέσος, middle, + ποταμός, river.] Pertaining to Mesopotamia, the region between the rivers Tigris and Euphrates in Asia, north of Babylonia. The name is sometimes extended to include Babylonia also. Mesopotamian are according to the contract of the contract lonia. The name is sometimes extended to include Babylonia also.—Mesopotamian art, a convenient general name including the kindred arts of ancient Chaldea, Babylonia, and Assyria—though these arts were not definitely limited to Mesopotamia proper. They constitute together one of the chief divisions of art development, and exerted an important influence upon Greek art, and hence upon succeeding arts for all time. See Assyrian, Babylonian, and Chaldean.

mesopræscutal (mes opræscutal) of or pertaining to the mesopræscutum + al.] Of or pertaining to the

mesopræscutum + -al.] Of or pertaining to the mesopræscutum.

mesopræscutum (mes'ō-prē-skū'tum), n.; pl. mesopræscuta (-tā). [NL., ⟨ Gr. μέσος, middle, + NL. præscutum, q. v.] The præscutum of the mesothoracic segment of an insect.

mesoprosopic (mes-ō-prō-sop'ik), a. [⟨ Gr. μέσος, middle, + πρόσωπον, face.] In craniom., intermediate between chamæprosopic and leptoprosopie — that is, with a face of moderate width; with a facial index of about 90.

mesopsyche (mes-op-si'kō), n. [⟨ Gr. μέσος. mid-mesopsyche (mes-op-si'kō), n. [⟨ Gr. μέσος. mid-mesopsych

with a facial index of about 90.

mesopsyche (mes-op-si'kē), n. [ $\langle Gr. \mu \ell soc$ , middle,  $+ \psi \nu \chi \dot{\eta}$ , spirit.] Haeckel's name for the midbrain or mesencephalon.

mesopterygial (mes-op-te-rij'i-al), a. [ $\langle mesopterygium + -al$ .] Of or pertaining to the mesopterygium opterygium.

mesopterygium (mes-op-te-rij'i-um), n.; pl. mesopterygia (-ξ). [NL.. ζ Gr. μέσος, middle, +

NL. pterygium.] The middle one of several basal cartilages which the pterygium of a fish, as an elasmobranch, may present, between the propterygium and the metapterygium. See

mesorhine (mes'ō-rin), a. [Properly mesorrhine (cf. Gr.  $\mu$ εσόρριν, having a middling nose),  $\langle$  Gr.  $\mu$ εσος, middle, +  $\dot{\rho}$ ις ( $\dot{\rho}$ ιν-), nose.) Having an index ranging from 48 to 53: applied to the nose, or to a person having such a nose.

Nose small, mesorhine or leptorhine. mesorhinian (mes-ō-rin'i-an), a. [<mesorhine + -ian.] Same as mesorhine. Nature, XXXV.

mesorhinium (mes-ō-rin'i-um), n.; pl. mesorhinia (-ā). [NL., ζ Gr. μέσος, middle, + ρίς (ρίν-), the nose.] In ornith., the part of a bird's beak which is situated between the external nostrils; the basal or internarial part of the

culmen. In some birds it runs up on the forehead, magnified or otherwise diversified, giving rise to the frontal shield or casque. See cuts at antia and shield.

mesocapula (mes-ō-skap'ū-lā), n.; pl. mesocapula (-lē). [NL., Gr. μέσος, middle, + NL. scapula, q. v.] The spine of the scapula, considered as a median element of that bone. W.

K. Parker.—Delta mesoscapuls. See delta.

mesoscapular (mes-ō-skap'ū-lār), a. [< meso-scapula + -ar³.] Of or relating to the mesoscapula.

At the scapular extremity of the clavicle there is often a piece of cartilage, considered to be segmented off from the end of the mesoscapula, and hence called mesoscapular segment.

W. H. Floner.

mesoscuta, n. Plural of mesoscutum.
mesoscutal (mes-\(\tilde{o}\)-sk\(\tilde{u}'\)-tal), a. [(mesoscutum +

mesoscutellar (mes-\(\tilde{o}\)-sk\(\tilde{u}'\)-te-l\(\tilde{a}\)r), a. Of or pertaining to the mesoscutellum.
mesoscutellum (mes'\(\tilde{o}\)-sk\(\tilde{u}'\)-te-l'um), n.; pl. mesoscutella (-\(\tilde{a}\)). [NL., \(\tilde{G}\)r, \(\tilde{t}\)scutellum, q. v.] In entom., the scutellum of the mesonotum; the scutellar sclerite of the mesothors. thorax.

mesosutum (mes-ō-skū'tum), n.; pl. mesoscuta (-tä). [NL., ⟨Gr. μέσος, middle, + NL. scutum, q.v.] In entom., the scutum of the mesonotum; the scutal sclerite of the mesothorax.

mesoseme (mes'ō-sēm), a. [⟨Gr. μέσος, middle, + σῆμα, a sign, mark, token.] In craniom., having an orbital index between 84 and 89.

Mesosemia (mes-ō-sē'mi-ā), n. [NL., ⟨Gr. μέσος, middle, + σῆμα, a sign, mark, token.] A genus of South American butterflies of the family Erycinida. It contains many brown or blue species, striped with black, and usually having a large round black spot in the middle of the fore wing.

mesosiderite (mes-ō-sid'e-rit), n. [⟨Gr. μέσος, middle, + σιδηρίτης, of iron: see siderite.] A name given by G. Rose (1864) to one of three subdivisions made by him in the classification of

divisions made by him in the classification of meteoric irons, these divisions being founded divisions made by him in the classification of meteoric irons, these divisions being founded on the comparative amount of iron and stony matter present. As defined by Brezina, in one of the method iron and stony chia + -an.] Of or pertaining to the Mesosumatter present. As defined by Brezins, in one of the most recent systematic classifications of the meteorites,

mesosiderite is a network of iron inclosing clivin and brouzite with more or less plagicclase, these minerals having so coarsely crystalline a texture that the characteristic structure is obscured. It forms a passage from the iron to the chondrites. The meteorite which fell at Estherville, Iowa, in 1879 is of this class. See meteorite.

ture is obscured. It forms a passage from the iron to the propterygium.

mesopterygium.

mesopterygoid (mes-op-ter'i-goid), n. [NL., < Gr. μέσος, middle, + NL. pterygoid, q. v.] That part of the petrygoid which in birds articulates with the palatal bone or with the basipterygoid process of the sphenoid, or with both.

mesopycni (mes-op-pik'ni), n. pl. [ML., < Gr. μέσος, middle, + πνκυόν, a small interval in music, neut. of πνκυός, close.] In medieval music, modes based upon a tetrachord having its halfstep in the middle.

mesorchial (mes-or ki-al), a. [⟨mesorchium + -al.] Of or pertaining to the mesorchium.

mesorchium (mes-or ki-al), a. [⟨mesorchium + -al.] Of or pertaining to the mesorectum.

mesorcetum (mes-or-ek'tal), a. [⟨mesorcctum + -al.] Of or pertaining to the mesorectum.

mesorcetum (mes-or-ek'tal), a. [⟨mesorcctum + -al.] Of or pertaining to the mesorectum, and the surface.

mesorcetum (mes-or-ek'tal), a. [⟨mesorcctum + -al.] Of or pertaining to the mesorectum.

mesorcetum (mes-or-ek'tal), a. [⟨mesorcctum + -al.] Of or pertaining to the mesorectum.

mesorcetum (mes-or-ek'tal), a. [⟨mesorcctum + -al.] Of or pertaining to the mesorectum (mes-or-tal), n. [NL., ⟨Gr. μέσος, middle, + NL. rectum, holding this gut in place.

mesoretina (mes-or-et'i-nä), n. [NL., ⟨Gr. μέσος, middle, + πνέρος, seed.] In bot., a membrane from the surface.

mesoretina (mes-or-et'i-nä), n. [NL., ⟨Gr. μέσος, middle, + πνέρος, seed.] In bot., a membrane of a spore when it is possible to distinuish three layers, as in the spores of Onoclea Struthiopteris.

mesoretina (mes-or-ri'nal), a. [⟨mesorhine + -al.] Internasal; internarial; situated between the nostrils: said specifically of the mesorhine (mes'ō-rin), a. [Properly mesorrhine the metasoma.

mesore of the intestine, between the mesorestum (mes-or-sō'ri'nal), a. [⟨mesorhine + -al.] Internasal; internarial; situated between the nostrils: said specifically of the mesorhine (mes'ō-rin), a. [Properly mesorrhine the condition of metabolic language.]

mesosterna, n. Plural of mesosternum.

mesosternal (meso-ster'nal), a. [< mesosternum + -al.] Of or pertaining to the mesosternum: as, a mesosternal sternite.

mesosterneber (mes - ō - ster' ne - ber), n. [⟨
NL. mesosternebra, ⟨ Gr. μέσος, middle, + NL.
sternebra, sterneber: see sterneber.] Any one of
the intermediate sternebers or pieces of the
breast-bone which intervene between the manu-

brium of the sternum and the xiphoid or ensiform appendage. There are usually several such bones in mammals and various reptiles, as the four composing the gladiolus in man.

mesosternebra (mes-ō-ster ne-bra), n.; pl. mesosternebræ (-brē). [NL.] Same as mesoster-

mesosternebral (mes-ō-ster'ne-bral), a. [<mesosterneber + -al.] Pertaining to a mesosterneber.

sterneber.

mesosternum (mes-ō-ster'num), n.; pl. mesosterna (-nĕ). [NL., ⟨Gr. μέσος, middle, + NL. sternum, q. v.] 1. In anat., the piece or pieces of a breast-bone which has several segments lying between the presternum and the xiphisternum: said chiefly of the segmented sternum of mammals. segmented sternum of mammals. In man it is the gladiolus or body of the sternum proper, as distinguished from the manubrium and the xiphoid cartilage.

2. In entom., the ventral or sternal sclerite of the mesothorax; the un-

der side of the mesothorax, opposite the mesonotum.

mesostethium (mes-ō-stē'thi-um),
n.; pl. mesostethia (-ā). [NL., <
Gr. μέσος, middle, + στηθίον, dim. of
στήθος, the breast.] In entom., the
metasternum, or large piece between the bases of the middle and
the posterior large. It is consultated the posterior legs. It is conspicuous in beetles. Kirby.

mesostylous (mes-ō-sti'lus), a. [(Gr. μέσος, middle, + στῦλος, a pillar: see style².] Same as mid-styled. See heterostylism.

mesosuchious (mes-ō-sū'ki-us), a. [< Mesosu-chia + -ous.] Same as mesosuchian.

mesotarsus (mes-ō-tār'sus), n.; pl. mesotarsi (-si). [NL.,  $\langle$  Gr.  $\mu$ toro, middle, + NL. tarsus, q. v.] In entom., the whole tarsus of the second or middle leg of a six-footed insect, coming between the metatarsus of the hind leg and the

protarsus of the fore leg.

nesothelial (mes-ō-thē'li-al), a. [< mesothe-lium + -al.] Of or pertaining to mesothe-

lium.

mesothelium (mes-ō-thē'li-um), n. [NL., < Gr.
μέσος, middle, + NL. (epi)thelium, q. v.] The
epithelium lining the entire primitive cœlom
or body-cavity of the embryo; the cœlarium.

Mesotheriidæ (mes-ō-thē-rī'i-dē), n. pl. [NL., <
Mesotherium + -idæ.] A family of extinct quadrupeds from the Pliocene of South America,
representing a very generalized type, allied on
the one hand to the rodents and by some made
a suborder, Hebetidentati, of Rodentia, by others referred to the Subunaulata or polydaetyl ers referred to the Subungulata or polydactyl ers referred to the Subungulata or polydactyl ungulates. There are clavicles, as in no other known ungulates, and four lower incisors, as in no known rodents; the mandibular condyle is transverse, and the maxillaries articulate with the nasals. There are in each upper half-jaw 1 incisor, no canines, 2 premolars, and 3 molars, and in each lower half-jaw 2 incisors, no canines, 1 premolar, and 3 molars—in all, 24 teeth.

Mesotherium (mes-ō-thē'ri-um), n. [NL.,  $\langle$  Gr.  $\mu\ell\sigma\sigma_{\zeta}$ , middle, +  $\theta\eta\rhoi\sigma_{\zeta}$ , a wild beast.] A genus of fossil rodent-like ungulate quadrupeds, typical of the family Mesotheriidæ, upon which is based the prime division Hebetidentati. M.

mesothoracic (mes'ō-thō-ras'ik), a. [< meso-thorax (-ac-) + -ic.] Of or pertaining to the mesothorax of an insect.—Mesothoracic case.

Same as meothoracotheca (mes-ō-thō'ra-kō-thō'kä),
n.; pl. mesothoracothecæ (-sē). [NL., < meso-thorax (-ac-) + Gr. θήκη, a case.] In entom., the mesothoracic case, or that part of the integument of a pupa covering the mesothorax. In the Lepidoptera and Diptera the other thoracic cases are indistinguishable from this, and it is then called the tho-

mesothorax (mes-ō-thō'raks), n. [NL., Gr. μέσος, middle, + θωραξ, chest: see thorax.] In entom., the second or middle one of the three divisions of the

thorax, situated be-tween the prothorax and the metathorax, and bearing the sec-ond pair of legs and the first pair of wings. When very large, as in dipterous insects, it is simply called the tho-

mesotrocha (me-sot'-Mesothorax, shaded, between protocorax (a) and metathorax (b); c, head; d, two abdominal or circular: see trochee.] Ciliated rō-kä), n. pl. [NL., ⟨Gr. μέσος, middle, +

chee.] Ciliated embryos of polychætous annelids in which one or many bands of cilia encircle the middle of the body. See atrocha, tele-

midst of the bones forming the tympanic pedi-cle of a fish; symplectic: correlated in Owen's nomenclature with epitympanic, hypotympanic,

and pretympanic.

II. n. The mesotympanic bone, now called the symplectic. See cut under palatoquadrate.

The pterygoid abutting upon the hypotympanic, be-tween this and the epitympanic are the mesotympanic and the pretympanic. Owen, Anat. Vert. (1886), I. 106.

mesotype (mes'ō-tīp), n. [NL., ζ Gr. μέσος, middle,  $+\tau i\pi o_{\zeta}$ , impression, type: see type.] In mineral., a name early given to several minerals of the zeolite group which are now recognized as distinct species. It included natrolite or soda-mesotype, scolecite or lime-mesotype, mesolite or lime-soda mesotype, and also thomsonite.

Its pods are twisted into spiral cylinders, whence the above name, and that of screw-bean. They are ground into meal and used as food by the Indiana, also serving as fodder.

The Mexican name is tornilla.

The fruit of the mesquit-bean (mes'kēt-bēn), n. The fruit of the mesquit-tree.

lite or soda-mesotype, scolecite or lime-mesotype, mesolite or lime-soda mesotype, and also thomsonite.

mesovarian (mes-ō-vā'ri-an), a. [{ mesovarium mesovarium (mes-ō-vā'ri-um), n. pl. mesovarium (mes-ō-vā'ri

Mesozoic (mes-ō-zō'ik), a. [⟨ Gr. μέσος, middle, + ⟨ωή, life.] In geol., lying, as a part of the geological series so designated, between the Paleozoic and the Tertiary rocks. It is a synonym of Secondary as that term is employed by geologists. The whole series of fossiliferous rocks is divided into Paleozoic, Mesozoic or Secondary, and Cenozoic or Tertiary. The principal subdivisions of the Mesozoic are the Trias or Triassic, the Jura or Jurassic, and the Cretaceous. (See these terms.) The Mesozoic is distinguished for the great development of the Reptilia, and its period has hence been called the "Age of Reptiles." In the Mesozoic occur the first traces of mammals, of birds, and of fishes with bony skeletons, as well as the first palms and angiosperms.

mesozoōn (mes-ō-zō'on), n. [NL., ⟨ Gr. μέσος, middle, + ζωον, animal.] One of the Mesozoo.

Mespilus (mes'pi-lus), n. [NL. (Tournefort, 1700), ⟨ L. mespilus, also mespilu, mespilum, ⟨ Gr. μέσπίλη, medlar-tree: see medlar.] A genus of rosaceous plants of the tribe Pomeæ, characterized by the bony endocarp of the fruit and the expanded mouth of the leafy calyx. They are shrubs or small trees, which are more or less thorny when wild, and have undivided, nearly sessile leaves, and large white or pink-ish flowers, solitary and sessile on short leafy branches. The fruit is nearly globular or pear-shaped, and is crowned by a broad, hairy disk, from which the five bony cells slightly protrude. mesquit<sup>2</sup>, mesquite<sup>2</sup> (mes'kēt or mes-kēt'), n.
[Also mezquite, meskit, etc.; < Sp. mezquite; of

Mex. (?) origin.] 1. An important leguminous
tree, or often shrub, Prosopis juliftora, growing from Texas to southern California, and
thence southward to Chili. It reaches a height of
30 or 40 feet, but is often scrubby, forming dense clumps
of chaparral. Under the action of prairie fires it is reduced to a low shrub, developing then an enormous mass
of roots, locally known as underground/orest, of great value
as fuel. The wood is heavy and very hard, almost indestructible in contact with the ground; it is used for the

beams and underpinnings of adobe houses, for posts and fencing, for fuel, and for furniture. It is of a brown or red color, handsome when polished, but difficult to work. The bean-like pods, before maturity, become pulpy and exceedingly rich in grape-sugar. They are eaten by the Indians as well as by whites, and furnish a valuable fodder for horses. The shrub also exudes a gum resembling gum arabic, which in Texas and Mexico is collected in considerable quantities for export. Also called honey-mesquit, honey-locust, honey-pod, and July-fouer. The Spanish name is algarrobs.

2. Same as mesquitatures.

metagenesis (met-a-jen'e-sis), n. [NL., < Gr. μετά, beyond, after, + γένεσις, production: see genesis.] In biol., that modification of parthenogenesis or alternate generation which is exhibited when an organism passes from the egg to the imago through a series of successively generated individuals differing from one another in form: distinguished by Owen from metamorphosis or the transformation of any metamorphosis, or the transformation of any one individual by the modification of its form as a whole. Metagenesis of one or another kind is exhibited by some insects, as aphids, in which the process

is commonly called parthenogenesis; by various internal parasites, as Distoma (see cuts under cercaria); and strikingly by various hydrozoans. In the last the cycle includes (1) the free-awimming impregnated ovum; (2) the fixation of this ovum to some submerged object and its development into an organism; (3) the formation by such organism of various zoolds, as nutritive and generative zoolds, unlike each other and unlike the parent, the whole forming a hydroid colony; and (4) the formation by generative zoolds of ova, which on being set free complete the cycle. Thus, in a sertularian polyp the ovum is a free-awimming ciliated body, which on fixation develops a mouth and tentacles, and by continued geometrio produces two sets of buds, of which the generative set reproduce the free-awimming ciliated ova. In other polyps, as Corynidae, the set of generative buds themselves become detached as free medusoids like jelly-fish (see cut under medusoid), whose eggs develop not into bodies like the parent medusoid, but into the polypide or polypidom of the hydroid colony on which they were produced. In the Lucernarida a similar metagenesis cocurs by fission. Herbert Spencer adopts Owen's metagenesis as one of three kinds of his agamogenesis, and considers it as (1) external, where new individuals bud from unspecialized parts of the parent, and (2) internal, as in the case of the transformations of Distoma. See metamorphoesis.

An elementary substance, or one which in the present state of chemical science is undecompos-

able, and which possesses opacity, luster of a peculiar kind (commonly called metallic, because very characteristic of the metals), concause very characteristic of the metals), conductivity for heat and electricity, and plasticity, or capability of being drawn, squeezed, or hammered with change of shape but no loss of continuity. Examples of metals possessing all these qualities, although in varying degree, are gold, silver, copper, iron, lead, and tin, all of which have been known from remote antiquity; and on the characters which they possess the idea of a metal was, and mainly still is, founded. These metals also have a high specific gravity, the lightest of them (tin) being over seven times as dense as water. Of the prehistorically known metals, gold, silver, and copper occur more or leas abundantly in the native or metallic form, and must have been noticed, and in all probability utilized, in the most remote antiquity, by various nations and over widely extended areas. Iron also occurs native, especially in the form of meteoric iron, and in this way may have first become known and utilized. But iron is now, and has been from time immemorial, smelted from its ores in countries which, from almost every other point of view than the metallurgical, might properly be regarded as uncivilized. The use of iron other than meteoric was not, however, known in the New World before the advent of Europeans. This and lead do not occur in the metallic form in nature, unless in very minute quantity; hence, where used, these metals must have been obtained by the metallurgic treatment of their ores. In the case of tin and zinc, as well as of other metals not occurring native, it was not until long after some knowledge had been attained in regard to the practical use of their orea, either by themselves or as ingredients in various altoys, that any accurate idea was obtained of the metal sinc, and it is not at all unlikely that the same was the case with bronze and one of its constituents, tin. In addition to the six metals aiready mentioned, quicksiliver was a liquid at the ordinary temperature and that when frozen it was malleable. It was not until the fifte ductivity for heat and electricity, and plas-ticity, or capability of being drawn, squeezed, or hammered with change of shape but no loss known as natine platina. Up to this time all the known substances to which the name metal was applied were much heavier than water, and also decidedly heavier than those considered as non-metallic. Hence, as the old and long-prevailing idea that all metals were malleable had been done sway with, a high specific gravity began to be considered as their most important characteristic. Thus we find Cronstedt, who was one of the earliest systematic writers on mineralogy (the first edition of his work was published in 1769), defining metals as "those mineral bodies which with respect to their volume are the heaviest of all hitherto known bodies." With the discovery, by Davy, in 1807, of the metallic nature of the bases of the alkalis a great change took place in this respect, for these substances, metallic from many points of view, especially with reference to their chemical affinities, are lighter than water, and at first, on this account, were by some chemists not admitted to rank as metals. The discovery of the metallic bases of the alkalis was followed by that of the bases of the actioum, barium, and strontium, 1807; zirconium, 1824; aluminium, glucinium, and yttrium, 1828. These metals are all light as compared with the older metals, but heavy in comparison with the metallic bases of the alkalis, the lightest of which—lithium, discovered in 1818. Has only a little more than half the specific gravity of water. Cadmium, another heavy metal associated with zinc in its mode of occurrence, and of some importance in the arts, was also separated from its oxid in 1818. Many metals have been discovered within the past few years, all of great interest from the scientific point of view, but no one of them of economical importance, or occurring in sufficient quantity to be utilized to any extent even if possessing valuable properties. So doubtful and difficult are the chemical reactions of some of these elements that their exact number cannot be stated. Several have been worked over by chemists for years without any definite

meta.]

are sulphur, phosphorus, fluorin, chlorin, iodine, bromine, silicon, boron, carbon, nitrogen, hydrogen, oxygen, and selenium; all the other elements are considered to be metals, and selenium was formerly generally so considered, but latterly it has been decidedly included among the non-metals, and the name has been changed by some to selenion, to make it correspond with carbon, boron, and silicon, with which elements it is to a certain extentenenically affiliated. Tellurium, on the other hand, although closely related chemically to sulphur and selenium, has always been classed among the metals, chiefly because, although brittle, it has a decided metallic luster. The names of the metals, so far as is possible, all end in -um; even platins is frequently written platinum. A division of the elements into metals and non-metals is recognized by chemists at the present time as being rather a matter of convenience from the popular point of view than as one capable of exact scientific definition. The words metallic and metal, however, cannot be dispensed with in common life and the arts, and their use can very rarely lead to any confusion. The exceptions to this general statement that the metals have a "metallic" luster, and that the non-metals do not, are, on the whole, extremely insignificant. Only in the case of selenium and phosphorus in certain of their allotropic forms could there be any question as to whether the term metallic luster could properly be used with reference to a non-metal.

metal. (met'al), v. t.; pret. and pp. metaled or metalled, ppr. metaling or metalling. [< metal, n.] To put metal on; cover, as roads, with broken stones or metal.

metal. An abbreviation of metallurgy.
metal-bath (met'al-báth), n. See bath1.
metal-casting (met'al-kàs'ting), n. 1. The
act or process of producing casts in metal by
pouring it when in a state of fusion into a mold. -2. A piece of cast metal having a form that adapts it for use in machinery, manufactures,

metaldehyde (me-tal'dē-hīd), n. [ζ Gr. μετά, with, + E. aldehyde.] A substance into which aldehyde is partially converted in contact with acids at a low temperature. It is a white crystalline solid.

metaled, metalled (met'ald), a. 1. Covered with metal, especially with road-metal or ballast; macadamized: as, newly metaled roads.— 2†. Full of fire or ardor; mettled; dazzling; glancing. See mettled.

Inncing. See messure.

I hate such measur'd, give me metall'd fire.

That trembles in the blaze, but then mounts higher.

metalepsis (met-a-lep'sis), n. [L., < Gr. μετά-ληψε, participation, assumption, alternation, < μεταληπτός, partaken in, < μεταλαμβάνειν, partake in, < μετά, among, + λαμβάνειν, take.] A rhetorical figure or trope assumed by some ancient writers, and supposed to consist in substituting a word force streamer home. substituting a word for a synonym or homonym, which latter is at the same time understood in a metaphorical or transferred sense: as, "sable caverns" for "black caverns," this in its turn meaning "dark or gloomy caverns."

The sence is much altered & the hearers conceit strangly entangled by the figure Metalepeis, which I call the farfet.

Puttenham, Arte of Eng. Poesie, p. 152.

metalepsy (met'a-lep-si), n. [ζ Gr. μετάληψις, alternation: see metalepsis.] In chem., change or variation produced by the displacement of an element or radical in a compound by its chemical equivalent: same as substitution.

Among the most metallic of the metals is a gas.

J. N. Lockyer, Spect. Anal., p. 167.

Characteristic of a metal: as, a metallic luster .- 3. Having one or more properties resembling those of metals: as, a metallic voice.

A distinct, hollow, metallic, and clangorous, yet apparently muffled, reverberation.

Pos, Fall of the House of Usher. Pos, Fall of the House of Uaher.

Pos, Fall of the House of Uaher.

Metallic-adamantine luster, a variety of luster intermediate between submetallic and adamantine, characteristic of pyrargyrite, some cerusite and octahedrite, etc.—

Metallic ammunition, bur, currency, dust, feather. See the nouns.—Metallic beetles, a collectors' name for coleopterous insects of the family Buprestida. See cut under Bupresti.—Metallic lath. See lathing!.—Metallic oxid, a compound of metal and oxygen.—Metallic paper, paper the surface of which is washed over with a solution of whiting, lime, and size. Writing done with a pewter pencil upon such paper is almost indelible.—Metallic salts, those salts which have a metal or metallic oxid for their base, as lead carbonate.—Metallic sales. See metallic feather, under feather.—Metallic standard. See sandard.—Metallic tinkling, in pathol., a high-pitched take heard in the lungs in pneumothorax, or in the case of a lung cavity under certain conditions.—Metallic-tissue loom. See loom!

Metallical† (me-tal'i-kal), a. [< metallic + -al.]

metallical (me-tal'i-kal), a. [< metallic + -al.] Same as metallic.

Now, by electrical bodies, I understand not such as are tetallical, mentioned by Pliny and the Antients.

Sir T. Browns, Vulg. Err., ii. 4.

metallically (me-tal'i-kal-i), adv. As a metal; by means of or by the use of metal; with a metal; as regards metallic properties.

They (two plates of different metals) are metallically connected together. Prece and Sivewright, Telegraphy, p. 8.

Let us conceive a metallically pure cylinder of wrought or cast iron.

Pop. Sci. Mo., XXXIV. 299. or cast iron.

metallicity (met-a-lis'i-ti), n. [< metallic + -ity.] The condition of being a metal; metallic character or constitution.

They [the alchemists] held that mercury enters into the omposition of all metals, and is the very cause of their setallicity.

Encyc. Brit., XVI. 32.

metallifacture (met'al-i-fak'tūr), n. [< L. metallifacture (met'al-i-fak'tūr), n. [< L. metallim, a metal, + factura, a making: see facture.] The manufacture of metals. [Rare.] of metalliferous (met-a-lif'e-rus), a. [= F. metalitis lifère = Sp. metalifero; < L. metallifer, yielding metals, < metallum, a metal, + ferre = E. bearl.]

Producing or yielding metal: as, metalliferous deposits or veins; a metalliferous district.

metalliform (me-tal'i-fôrm), a. [= F. metalliforme; < L. metallum, a metal, + forma, form.]

Having the form or properties of metal; like

metallify (me-tal'i-fi), v. t.; pret. and pp. me-tallified, ppr. metallifying. [< metal + -i-fy.] To convert into metal.

The Augustin process of silver extraction is only a peculiar mode of metallifying and collecting the silver of an ore after it has been by some preliminary operation converted into chloride or sulphate. Eneye. Brit., XXII. 70.

metallikon (me-tal'i-kon), n. [⟨Gr. μεταλλικόν, neut. of μεταλλικός, of metal, metallic: see metallic.] An English architectural surface-decoration, consisting of glass plates on which are cemented ornaments of glass, terra-cotta, etc.

metalline (met'al-in), a. [= F. métallin = It.

metalline; as metal + -ine<sup>1</sup>.] Of a metallic nature or quality; consisting of or like metal; containing metal: as, metalline water.

The quicksilver . . . [was] by this means brought to appear a very close and lovely metalline cylinder, not interrupted by interspersed bubbles as before.

Boyle, Works, I. 49.

metalling, n. See metaling.
metallist, metalist (met'al-ist), n. [< metal (L. metallum) + -ist.]

1. A worker in metals, or one skilled in the knowledge of metals.

The skilful metallist, that findeth and refineth those precious veines for publike use, is rewarded, is honoured.

\*\*Bp. Hall\*\*, Epistles, v. 7.

Perhaps for this reason he has recently reaped a golden harvest by carrying out the principles of the silver metallists.

Science, VIII. 75.

metallization (met'al-i-zā'shon), n. [=F.mé-tallisation = Sp.metallizacion = Pg.metallizacio; as metallize + -ation.] The act or process of metallizing, or forming or transforming into a metal. Also spelled metallisation.—Metallization of wood, the impregnation of wood with an inorganic substance, by which the pores become so completely filled that the wood acquires, to a certain extent, the qualities of a mineral.

metallize (met'al-iz), v. t.; pret. and pp. metallized, ppr. metallizing. [=F.métalliser=Sp. metallizar=Pg.metallizar; as metal + -ize.] To form or transform into metal; render metallic. Also spelled metallise.—Metallized glass. See glass.

metalloid (met'a-loid), a. and n.

metalloid (met's-loid), a. and n. [= F. métalloide; ⟨ Gr. μέταλλον, metal, + εlδος, form.] I. a. Relating to metalloids; like metal; having the form or appearance of a metal.

II. n. In chem., a term which has been variously applied: as, (a) to the metallic bases of the fixed alkalis and alkaline earths, probably in consequence of their low specific gravity; and (b) to all the non-metallic elementary suband (b) to all the non-metallic elementary suband (b) to all the non-metallic elementary substances. In the latter sense it is now used by chemista. The metalloids are thirteen in number: oxygen, bydrogen, nitrogen, carbon, chlorin, bromine, lodine, fluorin, sulphur, selenium, phosphorus, boron, and silicon. The distinction between a metal and a metalloid is, however, purely artificial, being based on physical rather than chemical criteria; but, broadly, a metal may be said to differ from a metalloid in being an excellent conductor of heat and electricity, in reflecting light more or less powerfully, and in being electropositive. Though a metalloid may possess one or more of these characters, it will not be

metallophone (me-tal'ō-fōn), n. [< Gr. μέταλ-λον, a metal, + φωνή, a sound.] 1. A pianoforte with graduated metal bars instead of strings.—2. An instrument like the xylophone,

strings.—2. An instrument tike the kylophone, but with metallic instead of wooden bars.

metalloplastic (met'a-lō-plas'tik), a. [⟨ Gr. μέταλλον, metal, + πλάσσειν, mold, form.] Pertaining to the arts of depositing metals or obtaining metal casts by either electric or chemical methods.

metalloscopic (met'a-lō-skop'ik), a. [< metalloscop-y + -ic.] Of or pertaining to metalloscopy.

Metall loscopic phenomens are most analogous to those ere described.

Amer. Jour. Psychol., I. 508.

metalloscopy (met'a-lō-skō'pi), n. [ $\langle$  Gr. μέταλλον, metal, + σκοπείν, view.] The art of determining by external application what metals or metallic substances act most easily and favorably upon a given person. The treatment of disease by the external application of metals. First formulated as a system by Burq in 1848, and hence often called Burqism, it has been recently revived by Charcot. Simple disks of various metals are employed in contact with the external parts of the body, from which different therapeutic results are claimed. Other observers assert that all the phenomena described as following the application of metals may be produced by disks of wood, and that whatever curative results are attained are due to mental effects, rather than to any special virtues emanating from the metals themselves.

The treatment of some cree is simple and easy: that of others is difficult and complex. Smelting implies the use of fire, or separation of the metal in the dry way, but processes carried on in the humid way are not unfrequently employed in the treatment of metalliferous ores. This is not ordinarily called smelting, but metallurgical treatment. The ores of many mining regions are treated at or near the place where they are mined, but it is not at all uncommon for ores to be carried to a great distance to be smelted. Thus, until within a few years, a large part of the copper used in the world was smelted at 8 wansea, in Wales, from ores brought from various countries, metallurgical skill and the command of cheap fuel making it desirable to have the ore treated there rather than at the place where it was mined. Abbreviated metal.

metalman (met'al-man), n. [< metal + man.] A worker in metals; a coppersmith or tinman. A smith, or a metalman, the pot's never from his nose.

Burton, Anat. of Mel., p. 110.

metalogic (met-a-loj'ik), n. [< Gr. μετά, after, + E. logic.] The part of metaphysics which concerns logic.

metalogical (met-a-loj'i-kal), a. [As metalogic + -al.] Beyond the province of logic; transcending the sphere of logic.

metal-plane (met'al-plan), n. A form of plane used to face soft metal plates by taking fine shavings from them. The angle of the cutter

with the sole is adapted to the hardness of the metal to be worked. metal-saw (met'al-sa), n. A hard steel saw with

fine teeth, stretched in a frame and used for sawing metal.

metamere (met'a-mēr), n. [Also metameron; <
Gr. μετά, after, + μέρος, a part.] In zoöl., one of a longitudinal series of parts which are serially homologous with one another. See metameric. metamerism. The construction of bilateneric. metamerism. serially homologous with one another. See metameric, metamerism. The construction of bilaterally symmetrical bodies by metamerism is common and usual in the animal kingdom, and is exhibited in such diversity of details that metameres have received several different names. The most general name is segment; but, since several morphologically distinct metameres may coalesce in one segment, the stricter term for an individual metamere, such as each morphological segment or ring of an annelid, crustacean, insect, or other articulate animal, is somite or arthromers. A morphological metamere of a vertebrate has been called a diarthromers. Compare actinomers and antimers.—Ambulacral metameres. See ambulacral.

metamerism (met'a-me-rizm), n. [As metamere + -ism.] 1. In chem., a form of isomerism, that property of certain compound bodies by which they have the same chemical elements combined in the same proportion and with the same molecular weight, while differing in chemical properties. Thus aldebyde and athless ord byte. same molecular weight, while differing in chemical properties. Thus, aldehyde and ethylene oxid have their elements in the same proportion, C<sub>2</sub>H<sub>4</sub>O, and the same molecular weight, 44, but are very different in their chemical properties. Two metameric bodies do not, however, belong to the same class or series of compounds. See isomerism, polymerism.

2. In zool., a metameric condition; the state

of being metameric; segmentation of the body of an animal along the primary or longitudinal axis, resulting in a series of more or less similar consecutive parts which are serially homologous. See metamere, antimere.

metamerization (met-a-mer-i-zā'shon), n. [<metamerize+-ation.] Division into metameres.

A very regular internal metamerization. Encyc. Brit., XVII. 828. metamerize (met'a-me-riz), v. t.; pret. and pp. metamerized, ppr. metamerizing. [< metamere + -ize.] To make metamerous; divide into metameres.

metamorphic (met-a-môr'fik), a. [= F. métamorphique; as Gr. μετά, among (denoting inter-change), + μορφή, form, + -ic. Cf. metamorpho-sis.] 1. Producing metamorphosis; changing the form or structure: transforming: as, a metamorphic cause or agency; metamorphic action.

—2. Exhibiting metamorphosis or metamorphism; changed in form or structure; metamorphosed. - Metamorphic rocks, in geol. See meta-

metamorphism (met-a-môr'fizm), n. [As meta-morph-ic + -ism.] The process of metamor-

phosing, or changing the form or structure; specifically, chemical change and rearrangement of the constituents of a rock by which they are made to assume new forms and enter into new combinations, the most important result of these changes being that the rock be-comes harder and more crystalline in structure. Comes narder and more crystalline in Structure. Thus, the metamorphic sistes are crystalline schista. The sedimentary rocks, especially those made up of the debris of fetdspathic minerals, are those med tibile to undergo metamorphism; hence it is that the argilizaceous rocks offer the most conspicuous examples of this process, and it is these which are most altered in external character to metamorphism; hence it is that the argilizaceous rocks to the sedimentary deposits to the sedimentary deposits to metamorphic changes, although the results are usually much less conspicuous to the eye unsided by a microscope than in the case of the sedimentary deposits. Examples of metamorphism are the conversion of ordinary earthy limestone into crystalline marble, of argiliaceous shales into various kinds of schists (mica-schist, tale-schist, etc.), and of sandstone into quartitle. Closely connected with the phenomena of metamorphism is the development in a rock of a laty cleavage or of a foliated structure. Metamorphic agencies and the results which they have brought about have been much studied late years by geologists, and the modern methods of lithological research have been most important sids in this direction. The most obvious and generally accepted classification of metamorphism. In the case of contact metamorphism the changes observed are apparently due—in morphism the changes observed as a partitly due—in morphism due to the development of th

metamorphopsia (met'a-môr-fop'si-ă), n. [< Gr. μεταμόρφ(ωσις), transformation (see metamorphosis), + ωψ, eye.] A pathological condition of the eyes in which objects appear elongated, irregular, or confused.

metamorphoscope (met-a-môr'fō-skōp), n. [<br/>Gr. μεταμόρφ(ωσις), transformation (see metamorphosis), + σκοπείν, view.] A toy in which pictured forms of human beings or other animals are made to interchange heads, bodies, legs, or wearing-apparel. The pictures are drawn or painted on a series of bands of muslin or paper, each having independent motion on rollers in a box, and each of a different length from the others. The bands are arranged with their edges as near together as possible, and the figures are painted across the entire series. The motion of the bands is made constantly to displace the parts of the different figures and recombine them in luddicrous fashion at a slot in the cover of the box.

metamorphose (met-a-mor/fos), n. [ F. méta-morphose = Sp. metamorfosis or metamorfosis = Pg. metamorphose = It. metamorfose,  $\langle$  L. metamorphosis, ( Gr. μεταμόρφωσις, a transformation: see metamorphosis.] A transformation in shape or character; metamorphosis.

Of human clay to divine gold?
Browning, Ring and Book, II. 217.

2. A marked change in the form or function of a living body; a transformation resulting from development; specifically, in zoöl., the course of alteration which an animal undergoes after its exclusion from the egg, and which modifies extensively the general form and life of the individual; particularly, in *entom.*, the transformations of a metabolous insect.

The term metamorphoni, in its technical entomological ense, is applied only to that succession of changes of which . . . a definite pupal condition forms the middle erm.

Huxley, Anal. Invert., p. 361.

3. In chem., that chemical action by which a given compound is caused, by the presence of a peculiar substance, to resolve itself into two or more compounds, as sugar, by the presence of yeast, into alcohol and carbonic acid.—4. In bot., the various changes that are brought

about in plant-organs, whereby they appear under changed or modified conditions, as when stamens are metamorphosed into petals, or under changed or modified conditions, as when stamens are metamorphosed into petals, or stipules into leaves. Metamorphosis does not imply that the petal, for example, has ever been a stamen, but it implies an alteration in the organizing force, which took effect at a very early period in the life of the organ, at or before the time when the primitive aggregation of cells became differentiated into the several parts of which its normally composed. It is due merely to the fact that the development of the organ has pursued a different course from what is usual. The various kinds of metamorphoses are described under the names of chlorosis, petalody, phyllody, pistillody, sepalody, staminody, etc. (which see).—Coarctate metamorphosis. See hometaboly and complete.—Imperfect or incomplete metamorphosis for gans, in bot., the progressive adaptation of one organ to several different purposes, connected with which are changes in size, color, and other particulars. [< F. métayer, < ML. medietarius, one who tills land for half the produce, < L. medieta(t-)s, middle place, half: see moiety, mediety.] A cultivator who tills a farm or piece of ground for the owner, on condition of receiving a share of the produce, generally a half, the owner generally furnishing the whole or a part of the stock, tools, etc. This system of cultivation, called *metayage* or the *metayer system*, prevails in the central and southern parts of France and in most of Italy, and is practised to a considerable extent in the southern United States.

considerable extent in the southern United States.

The principle of the metayer system is that the labourer or peasant makes his engagement directly with the landowner, and pays, not a fixed rent, either in money or in kind, but a certain proportion of the produce, or rather of what remains of the produce after deducting what is considered necessary to keep up the stock. The proportion is usually, as the name imports, one-half; but in several districts in Italy it is two-thirds. Respecting the supply of stock, the custom varies from place to place; in some places the landlord furnishes the whole, in others half, in others some particular part, as for instance the cattle and seed, the labourer providing the implements.

J. S. Mill, Pol. Econ., II. viii. § 1.

The metayer has less motive to exertion than the peasant proprietor, since only half the fruits of his industry, instead of the whole, are his own.

Metazoa (met-a-zō'ā), n. pl. [NL., pl. of metazoön, q.v.] All those animals which are above
the Protozoa, and which in the course of their
development undergo certain metamorphoses, the Protozoa, and which in the course of their development undergo certain metamorphoses, consisting of the primary segmentation of a true egg or ovum, and the subsequent passage through an embryonic condition in which they possess at least two distinct germinal layers; animals exhibiting cellular differentiation. The Metazoa are distinguished from the Protozoa in that the substance of the body is differentiated into histogenic elements—that is to say, into cells. In all the Metazoa the ovum has the form of a nucleated cell, the first step in the process of development being the production of a blastoderm by the subdivision of that cell, the cells of the blastoderm giving rise in turn to two layers of cells, endoderm and ectoderm, between which, in most cases, a mesoderm appears, to be itself split in two layers; such a four-layered germ developing finally all the histological elements of the adult body. With the exception of certain parasites, and the extremly modified males of a few species, all these animals possess a permanent alimentary cavity lined by a special layer of endodermal cells. Sexual reproduction is the rule, and very generally the male element has the form of fillform spermatozoa. The lowest term in the series of the Metazoa is represented by the Porifera or sponges. Those of the Metazoa which possess a notochord, and in the adult state have the trunk divided into segments or myotomes, constitute the subkingdom Vertebrata; the rest are the several subkingdoms of invertebrata; the rest are the several subkingdom of the detazoa (met-a-zo<sup>2</sup>an), a. and n. Is it not indisputable that man's body ... is composed of the very same materials, the same protein, and fats, and salines, and water, which constitute the inorganic world—which may unquestionably have served long ago as the dead material which was vivified and utilized in the bodies of extinct creatures, and which may serve in endless metensomatosis (if the word, which has the authority of Clemens Alexandrinus, and which is now imperiously demanded by the wants of science, may be pardoned on the score of necessity) for we know not what organisms yet to come?

A mineral or metallic mass of extraterrestrial

A mineral or metallic mass of extraterrestrial origin, or which, to use the common expression, has "fallen from the heavens." Bodies of this kind were formerly often called aerotics, but meterics is now their generally accepted name among scientific men. The fall of meteorities upon the earth is a by no means infrequent occurrence, and records of such events date back to many centuries before the present era. Traditions point to the very early use of meteoric iron for the manufacture of weapons: and it is also known that meteorites were not unfrequently the objects of worship in various parts of the world. In spite of this, the fall of rocks or metals from the heavens seemed to be so improbable an event that full credence was not given by scientific men to stories of such occurrences until about the beginning of the present century, when, several falls having taken place (at Barbotan, France, 1700; Slens, 1794; Wold Cottage, Yorkshire, Eng., 1706; Salés, France, 1798; Benarca, 1798; L'Alge, France, 1803), the details of some of which were thoroughly investigated, a further denial of their genuineness became impossible. From the time of the fall at L'Algie all doubt in the matter was abandoned. There are now several collections of meteorites, each of which contains specimens of between 800 and 400 different falls, and the whole number known is not far from 400, although it is by no means the case with all these occurrences that the specimens were seen to fall; many of them have been found on the earth's surface, but have been recognized as being extractratial by their peculiar appearance and composition. The most important facts with regard to meteorites may be concisely stated as follows: They have not been found to contain any element not known to occur on the earth's they have furnished no evidence of the existence of water beyond the earth's surface, but have been recognized as being extra science of water begond the earth's surface of a mass of the foundation of the presence of water of the solar systems of

and gives, when etched, figures which have generally been considered as Widmannstattian, although others have denied that they could properly be so denominated. The ter-restrial origin of the Ovifak iron is, however, now generally

admitted, although for a considerable time after its discovery this was not the case. The wide extent of the area over which this iron occurs, and its peculiarly intimate association with the minerals of which the basalt is made up, forbid the idea that the metal could have failen from above into lava in process of cruption, which was at first the favorite theory of its origin. Next in order to the adderolites come the pallasites, so named from the fact that a large metaorite of this class was in 1778 discovered in Siberia by the distinguished traveler Pallas. Under the name of pallasites comprehended those meteorites which consist of a spongy or vesicular mass of iron, the cavities of which are in most cases partly or entirely filled with oilvin, with which various other minerals are frequently associated, enstatite and bronzite being the most common, while chromite is of not infrequent occurrence. Both siderolites and pallasites belong to the class of metallic meteorites. By far the larger part of the stony meteorites are included under the designation of chardrice. In these the iron is distributed in fine particles through a more or less intimate mixture of silicates, with which chromite and magnetic pyrites are frequently associated, the silicates being chiefly olivin and bronzite. The name chondrite has reference to the fact that in this class of meteorites the material of which they are composed occurs in the form of rounded grains (chondri). The chondritic meteorites have, however, a quite varied structure, in some few cases passing into a breecia; they have been divided into numerous subgroups in accordance with these structural variations.

2. In music, the division of a composition into parts of equal time-value and of similar essential rhythmic structure. The smallest part thus indicated is that between successive primary accents, and is called a measure; in printed music this is marked by a bar before each primary accent. But meter includes also, in a general way, the division of a piece into equal and similar parts of more than one measure, such parts being called phrases or strophes. In this sense musical meter has obvious analogies with meter in verse, though the analogies cannot always be pressed with safety, especially as the nomenclature is not strictly parallel. (See metrics?, 2.) Rhythm may be distinguished from meter in that it deals primarily with the accents and the typical and actual accentual patterns, which meter gathers into groups and sections in accordance with their timevalue. This distinction, however, is not always observed or even acknowledged. Sometimes the meaning of the term is reversed, rhythm being made a matter of time, and meter one of accent. Sometimes, too, the two terms are made entirely interchangeable.

See foot and versification, hereafted the ball of the stanzas or strophes. phes, popularly called verses. See foot and versification. According to the kind of feet used, meters are usually either lamble, trochale, or dactylic. The principal lamble meters are: Common Meter (C. M.), having alternately eight and six syllables to the line; Long Meter (L. M.), having eight syllables to the line; and Short Meter (S. M.), having two lines of six syllables, followed by one of eight, and then by another of six. Each of these meters has properly four lines to the stanza, so that their syllable scheme is as follows: C. M., 8, 6, 8, 6; L. M., 8, 8, 8; S. M., 6, 6, 8, 6. Each of them may also be doubled, so as to make eight-lined stanzas, the meter then being called Common Meter Double (C. M. D.), Long Meter Double (L. M. D.), or Short Meter Double (C. M. D.). Long meter may also have six lines to the stanza, and is then called Long Meter, Six Lines, or Long Particular Meter (L. P. M.), with the syllable scheme 8, 8, 8, 8, 8. Other meters of this class are Common Particular Meter (C. P. M.), 8, 8, 8, 8, 5. Short Particular Meter (S. P. M.), 6, 6, 8, 6, 6, 8; Hallelujah Meter (S. P. It is the distance, at the melting-temperature of ice, between the ends of a certain platinum bar preserved in Paris, and called the metre des Archices. It was intended to be one ten-milliouth part of the earth's meridian quadrant, and to be 443.298 lines of the toise of Peru, from which it really differs by a very small amount. The meter is equal to 89.37027 inches according to General Comstock. A new meter has been established by the principal nations, which is defined by the length at the melting-point of ice between two lines drawn on a bar of planeau of Weights and Measures at the pavillon de Bretevil near Seyres, France. This new meter is to be as nearly as possible of the same length as the old one. Abbreviated m. meterage (mē 'tèr-āi). n. [\( \) meter \( \) + -age.

meter-prover (me'ter-pro'ver), n. A registering holder, or a gas-tank of known capacity, used for testing the accuracy of gas-meters. meter-wheel (me'ter-hwel), n. A drum or hollow wheel with several chambers, to which air or other gas is admitted through a tube in the axle. In use, the wheel is immersed in water above its axis, and the gas, filling each chamber successively, causes the chamber filled to rise and the wheel to revolve, when the gas is discharged above the level of the water by an opening. The chambers are of known capacity, and the revolutions of the wheel are recorded on dials. Such wheels are used in gas-meters, in which the pressure of the gas flowing through the meter gives the driving nower.

Same as methylic alcohol (which see, under alcohol).

methane (meth'ān), n. [ $\langle meth(yl) + -ane \rangle$ ] A hydrocarbon (CH<sub>4</sub>) belonging to the paraffin series, a colorless, odorless gas which may be reduced to a liquid by extreme pressure and reduced to a liquid by extreme pressure and cold. It is innocuous when breathed in moderate quantity. It burns with a slightly luminous fame, and when mixed with seven or eight volumes of air explodes violently. It occurs in nature in the emanations of volcanoes and petroleum-wells. It also occurs in large quantity in the coalmeasures, and when mixed with air constitutes the dreaded fire-damp of the miners. Also called marsh-gas.

Pope, Essay on Criticism, 1. 654.

The particular uses of method are various: but the general one is, to enable men to understand the things that are the subjects of it.

Bentham, Introd. to Morals and Legislation, xvi. 1, note.

Where the habit of Method is present and effective, things the most remote and diverse in time, place, and outward circumstance are brought into mental contiguity and succession, the more striking as the less expected.

Coleridge, Method, § ii. (Encyc. Dict.)

2. A system, or complete set, of rules of procedure for attaining a given end; a short way to a desired result; specifically, in logic, a general plan for setting forth any branch of knowledge whatever; that branch of logic which teaches how to arrange thoughts for investigation or exposition.

Method hath been placed, and that not amiss, in logic, as part of judgment: . . the doctrine of method containth the rules of judgment upon that which is to be delivred.

Bacon, Advancement of Learning, it.

Method is procedure according to principles.

5. In music: (a) Manner of performance; technique; style. (b) A manner or system of teaching. (c) An instruction-book, systematically arranged.—Acroamatic, analytic, antecedental method. See the adjectives.—Arbogast's method. [Named after the inventor, the Alastian mathematician Louis François Antoine Arbogas, 1759-1803, who himself named it the calculus of derivations.] A method for the development of the function of a function according to the powers of the variable of the latter function.—Bacconian method. See Baconian.—Catechetic method, the method of teaching by questions addressed to the memory.—Centrobaric method. See centrobaric.—Comparative method, any method of investigation which rests upon the comparison of several groups of objects.—Compositive method. See correlative.—Deductive method. See deductive.—Definitive or divisive method. See divisive.—Dialogic method. See dialogic.—Differential method. (a) A method of estimating the value of a physical quantity by comparing it with another of the same kind the value of which is known and estimating the difference. See differential, and differential galvanometer. (b) A method, introduced by Frischen, in dupler telegraphy for eliminating the effect of the transmitted current on the instruments at the transmitting station while leaving 1 them available to record any message received at the same time. See telegraphy.—Epidermic, crotematic, Enlerian, exoscopic, expectant method. See the adjectives.—Horner's method of approximation.—Introspective method, a method of persuring the electrical resistance of a circuit in which there is an electromotive force. See resistance.—Metaphysical o

At the recent meeting of the British Association, Dr. E. B. Tylor read an interesting paper on the laws of marriage and descent, illustrative of his ingenious method of studying ethnological phenomena. All myths and customs, on a close study, may by analysis be disintegrated, and are found to consist of certain elements. Dr. Tylor arranges these elements statistically, and, by inquiring which occur simultaneously among various peoples, proves that certain groups of such elements belong genetically together. This he calls the method of adhesions.

of the observation are specially chosen so that one usual source of error does not enter into the result.—Method of compensation, a method in which a source of error of unknown amount is got rid of by a special mechanical contrivance.—Method of concomitant variations, the method in which the known quantities on which the results of an experiment depend are made to vary with a view to ascertaining the values of the unknown quantities.—Method of correction, a method of experimentation in which a source of error is allowed for by calculation. This differs from the method of residues only in that the nature of the causes of the residual phenomena are known, and only their quantities remain to be determined.—Method of difference, that method in which an experiment is tried under conditions seeming to differ in but one material circumstance, and the difference in the two results is ascribed to that circumstance.—Method of dimensions, divisors, exclusions, fluxions. See dimension, divisor, etc.—Method of exhaustion, the method of approximation to the area of a curvilinear figure by means of inscribed and circumscribed polygons.—Method of increments, of indivisibles of infusion, of limits. See increment, indivisible, etc.—Method of least squares. See square.—Method of residues. (a) That method of experimental inquiry in which from an observed quantity is subtracted the effects of known causes in order that the effects of unknown causes may be studied by themselves. (b) A method invented by Cauchy of treating the integral calculus. See residual.—Method of reversal, a method in which two experiments are made under different circumstances, in such a way that their results can be combined by calculation, such a way that their results can be combined by calculation, of integration proceeding in a scientific manner, and stating out from fundamental and elementary principles operation, no effect is produced on the testing apparatus for example, the Wheatsone bridge method of measuring electrical resistance.—Progressive or res

Methodists; belonging to or agreeing with the general body of Methodists: as, Methodist principles; a Methodist church.—The Methodist Church, a Christian body existing in several distinct church organizations, the most important of which are that known in England as the Wesleyan and that known in the United States as the Methodist Episcopal Church. These two bodies do not differ materially in doctrine, worship, or ecclesiastical organization. They are evangelical, and Arminian in theology. Their worship is generally non-liturgical. Each Methodist society, or local church, is organized in classes, under class-leaders; the different societies, which are sometimes grouped in circuits, are combined in districts, each of which is, in the United States, under the superintendence of a presiding elder. The American churches also have bishops, who are not diocesan, but itinerant, possessing concurrent jurisdiction over the whole church. The highest ecclesiastical court is the General Conference, which meets every fourth year. In the United States lay delegates have been admitted to the Conference aince 1872, and in England since 1830, before which dates the Conference was a purely clerical body. Other Methodist in theology, formed from the Counters of Huntingdon's Connection, which is Congregational in polity; the Methodist New Connection, which is Congregational in polity; the Methodist New Connection, which gives a larger degree of power to the laity than does the Old Connection; the Bible Christians; the Primitive Methodist; the United Methodist Pree Churches, a combination of three preexisting Methodist organizations; and the Wesleyan Reform Union. All the above are British organizations. In the United States, the Methodist Episcopal Church (South). There is also an African Methodist Episcopal Church (South). There is also an African Methodist Episcopal Church in American Methodist Episcopal Church and Church, which rejects episcopacy; and the Wesleyan Methodist Connection of America. First adopted in France (definitely in 1799), it is in general use in most other civilized countries, except the English-speaking countries, and is now almost universally adopted for scientific measurements. Its use is permitted in Great Britain, and was legalized in the United States in 1868. The meter, the unit of length, was intended to be one ten-millionth part of the earth's merdian quadrant, and is so very nearly. Its length is 39.370 inches. (See meter<sup>2</sup>). The unit of surface is the are, which is 100 square meters. The theoretical unit of volume for the purposes of the market is the liter, which is the volume of 1 kilogram of distilled water at its maximum density, and is therefore intended to be 1 cubic decimeter. For 10 times, 1,000 times, and 10,000 times one of the above units, the prefixed dear, hedor, kilo, and myria—are used. For h. 180, 180 gram for the market is the intersectional commission, is one millionth of a meter. The following is a complete table of equivalents:

1. The art of versification.—2. The science or doctrine which treats of rhythm in language and doctrine which treats of rhythm in language and its employment in poetic composition. Both as an art and as a science metrics is a branch of rhythmics, and relates to rhythm in language as music or harmonics does to musical rhythm, and orchestics (regarded as an art or science by the ancients) to rhythm in the movements of the body. It is a distinct science from grammar in its proper sense, the only department of which approaching metrics is that called prosedy—that is, the study of quantity or the determination of longs and shorts in spoken language. As a matter of convenience grammars have added to this elementary or empiric treatises on versification, and so in traditional and popular usage proceedy is made equivalent to metrics. In metrical composition the unit is the time (mora) or the syllable. In the nomenclature of modern metrics syllables combine into feet or measures, these into lines, and lines into stanzas or strophes. In the more exact and complete terminology of ancient metrics times or syllables combine into feet or measures, measures into cola, lines (verses), or periods, periods into systems or strophes, strophes into pericopes, and lines, periods, systems, or pericopes into poems. Also metric.

2. Eccles.: (a) In the early Christian church, the bishop of the municipal capital of a province or eparchy, who had a general ecclesias-

tical superintendence over the bishops and metrorrhea, metrorrhœa (mē-trō-rē'ā), n. churches of his province, confirmed, ordained, and when necessary excommunicated the bishops, and convened and presided over the pro-as of mucus. ops, and convened and presided over the provincial synods. The superiority in rank of the bishops of the principal sees was so early established that many authorities have held that the office of metropolitan (including also under this title the primates of patriarchal sees) was of apostolic origin. In the developed organization under the Christian emperors a metropolitan ranked above an ordinary bishop and below a patriarch or exarch. In medieval times the power of most of the metropolitans in western countries became much diminished, while that of the diocesan bishops and the pope was relatively increased. See archbishop and primate.

(Rottböll), ⟨ Gr. μήτρα, the pith or heart of a tree, + ξύλον, wood.] A genus of palms, known to older writers as Sagus (Blume), of the tribe Lepidocaryæ and the subtribe Calameæ. They bear fruit but once, and are characterized by robust stems and branching spikes. They are large trees with terminal suberect pinnately cut leaves having opposite linear-land colate segments: the spadix has a coriaceous prickly spathe. Seven species are known, indigenous in the Malay archipelago. New Guinea, and the Fiji Ialanda. M. Lævis and M. Rumphii, natives of Siam, the Malayan islands, etc., are the proper sago-palms. The former grows from 25 to 50 feet high, and has a rather thick trunk, covered with leaf-scars, which bears a graceful crown of large pinnate leaves, from the center of which arise the pyramidal flower-spikes. The latter is a much smaller tree, further distinguished by the sharp spines borne on its leaves, and flower-sheaths. These trees flower when about fifteen years old, and require nearly three years to ripen their fruit, after which they die. (See sago.) M. Rumphii is a littoral tree which forms dense growths; M. Lævis grows in swamps. M. amicarum, a species in the Friendly Islands, yields seeds which serve as a vegetable ivory.

[It., <

nishing and scraping away, to a variable extent, of a uniformly roughened surface consisting of of a uniformly roughened surface consisting of minute incisions, accompanied by a bur, produced by an instrument called a cradle or rocker. This surface is left nearly undisturbed in the deepest shadows of the subject, but is partially removed in the middle tinta, and completely in the highest lights. Thus treated, the plate, when inked, prints impressions graded in light and shade according to the requirements of the design, from a rich velvety and perfectly uniform black up through every variation of tone to brilliant white, or showing, when desirable, the sharpest contrasts between the extremes. This style of engraving, invented by Van Siegen, a Dutchman, in 1643, though erroneously ascribed to his pupil Prince Rupert, has been pursued with most success in England. The defect of the process is that it does not admit of clear and sharp delineation of forms; hence in modern practice the outline of the design is strongly etched with acid before the cradle is used, and texture is often given to the finished plate by lines produced by dry-point etching.

One of a group of minerals all of that it was related to L. metare, since, git-ter.] 1. One of a group of minerals all of which are characterized by their very perfect basal cleavage, in consequence of which they can be separated easily into extremely thin, basal cleavage, in consequence of which they can be separated easily into extremely thin, tough, and usually elastic laminæ. They occur in crystals with a prismatic angle of 120°, but more commonly in crystalline aggregates, often of large plates, but sometimes of minute scales, having a foliated structure, the folia being generally parallel, but also concentric, wavy, and interwoven, and also arranged in stellate or plumose and sometimes almost fibrous forms. In crystallization the micas belong to the monoclinic system, but they approximate very closely in form in part to the orthorhombic system (e. g., muscovite), in part to the rhombohedral system (e. g., blotite). The micas are silicates of aluminium with other bases, as iron, calcium, magnesium, potassium, sodium, lithium; in some kinds fluorin is present in small amount. The prominent varieties are—muscovite or common potash mica, the light-colored mica of granite and similar rocks, and paragonite, which is an analogous soda species; biotite, or magnesia mica (including meroxene and anomite, distinguished according to the position of the optic axial plane), the black or dark-green mica of granite, hornblende rocks, etc.; phlogopite, the brouze-colored species common in crystalline limestone and serpentine rocks: lepidomelane, a black mica containing a large amount of iron; and lepidolite, the rose-red or iliac lithia mica occurring commonly in aggregates of scales. (See further under these names.) The micas enter into the composition of many rocks, including the crystalline rocks, both metamorphic and volcanic (as granite, gneiss, mica-schist, trachyte, diorite, etc.), and sedimentary rocks (as shales and sandstones), sometimes giving them a laminated structure. In the sedimentary rocks they are in most cases derived from the disintegration of older crystalline rocks. Mica

(muscovite) is often used in thin transparent plates for spectacles to protect the eyes in various mechanical processes, in reflectors, instead of glass in places exposed to heat, as in head-lights and stove and lantern-lights, and even for windows in Russia (hence called Muscovy glass). Ground to powder, it is combined with varnish to make a glittering coating for wall-papers, and is used also in preparing a covering for roofs, and as a packing and lubricator for machinery. It is often vulgarly called tinglass. The so-called brittle micas include a number of species, as margarite, seybertite (clintonite), etc., which are related to the true micas, but are characterized by their brittle folia.

2. In the preparation of kaolin for use in the 2. In the preparation of kaolin for use in the manufacture of porcelain, one of the second set of channels through which a mixture of water and suspended clay washed out by the water from the broken clay-bearing rock is slowly passed to obtain the deposition of flakes slowly passed to obtain the deposition of flakes of mica and other foreign substances, and thus to purify the clay, which is finally allowed to subside in a series of pits or tanks. Each of the first set of channels through which the mixture is passed for the settling of the coarser flakes of mica, etc., is called a drag. This set of channels is collectively called the drags, and the second set the micas. See porcelain and knotin.— Copper mica. Same as endecophyllite.—Ithia mica. The relative proportion of the two minerals differs often very considerably even in the same mass of rock. The usual mica in a typical mica-schist is the species called muscovite; this, however, is sometimes replaced to a certain extent by biotite or paragonite. Mica-schist passes readily into tale-schist and chlorite-schist; and when feldspar is added to the other constituents of the rock it becomes gneiss. It is one of the most abundantly distributed of the so-called crystailine or metamorphic rocks, and, with granite, gneiss, and the other members of the schist family, forms the main body of the rocks formerly designated as primitive.

[NL., dim. of L. mica, a crumb, grain: see mica<sup>1</sup>.] One of the hypothetical crystalloid bodies or plates supposed by Nägeli to be the units out of which organized bodies, more particularly or which organized bodies, more particularly plants, are built up. These micells were supposed to be aggregates of larger or smaller numbers of chemical molecules, and were determined by the optical properties exhibited by cell-walls, starch-grains, and various proteid crystalloids. From their optical properties it was concluded further that they were biaxial crystals, and they were assigned, as a probable form, that of parallelepipedal prisms with rectangular or rhomboid bases.

The featival is called in full the Festioal or Feast of St. Michael and All Angels. It appears to have originated in a local celebration or celebrations, and seems to have already existed in the fifth century. The Greek Church dedicates November 5th to St. Michael, St. Gabriel, and All Angels; the Armenian and Coptic churches also observe this day.

It is characterized by terminal inflorescence, 4-or 8-parted flowers with obtuse petals, and a calyx which has a cylindrical tube and usually a 4-to 8-lobed limb. They are trees or shrubs, with very variable foliage, and white, rose-colored, purple, or yellowish flowers, which are small, and grow in terminal or very rarely lateral clusters. About 490 species have been enumerated, all confined to tropical America. Quite a number are cultivated for ornament. They sometimes receive the name of West Indian currant-bush.

ly, as to its animal or vegetable nature. The term is most frequently applied to various microscopic plants or their spores (particularly Schizomycetes), and further has come to be almost synonymous with bacterium. Taken in this latter sense, microbes are regarded as essentially polymorphous organisma, adapting themselves to varied conditions of existence, which in turn influence the form taken by them. For this reason their classification has often varied, since their distinction into genera and species does not yet rest on precise data. Micrococcus, Spirochaste, Bacillus, Leptohrix, Bacterium, Vibrio, Spirillum, and Myconostoc are the genera or form-genera under which most of the forms are known. They are instrumental in the production of fermentation, decay, and many of the infectious diseases affecting man and the lower animals.

Microchiroptera (mi'krō-kī-rop'te-rā), n. pl. [NL., ζ Gr. μικρός, small, + NL. Chiroptera, q. v.]. A suborder of Chiroptera, including the insectivorous or animalivorous (rarely frugivoinsectivorous or animalivorous (rarely frugivorous or blood-sucking) bats. They have a simple stomach (except Demodonies); a large Spigelian and generally small caudate lobe of the liver; the tail contained in the interfemoral membrane when present, or freed from its upper surface; the rim of the ear incomplete at the base of the auricle; the index-finger rudimentary or wanting and without a claw; the palate not produced back of the molar teeth; and the molar teeth cuspidate. The group includes all bats except the family Pteropodida (which constitutes the suborder Megachiroptera), inhabiting most parts of the world, and falling into two large series, the vespertilionine alliance and the emballourine alliance, the former of three families, the latter of two. Animalizora, Entomophaga, and Insectivora are synonyms of Microchiroptera.

Microchiropteran (mi "krō-ki-rop"te-ran), a. and n. I. a. Of or pertaining to the Microchiroptera.

Micrococcus (mī-krō-kok'us), n. [NL., ⟨Gr. μκρός, small, + κόκκος, a berry, kernel: see coccus.]

1. A genus of Schizomycetes (fission-fungi or bacteria), and the only one of the tribe Spherrobacteria. It is characterized by globular or oval slight-

ly colored cells, either formed by transverse division into filaments of two or several chaplet-like articulations, or united in families, or segregated in gelatinous masses, all destitute of spontaneous movement but exhibiting a simple molecular tremor. Its species are divided into three physiological groups — chromogenes, producing coloring matter, as in "red mill." (M. prodigionus, figured under microbe), or "golden yellow" (M. iuteus); zymogenes, producing various termentations, as in animal and vegetable infusions (M. crepusculum) or urine (M. ures); and pathogenes, producing diseases. Variola, vaccinia, septicemia, erysipelas, gonorrhea, and other forms are believed to be produced by micrococci. 2. [l. c.; pl. micrococci (-si).] Any member of this genus.

Microgaster (mī-krō-gas'ter), n. [NL. (Latreille, 1804), ⟨ Gr. μικρός, small, + γαστήρ, stomach: see gaster².] 1. A notable genus of parasitic hymenopters of the family Braconidæ, giving name to the subfamily Microgasterinæ. They are characterized by the three submarginal cells of the fore wings (the second one often incomplete), and by having the hind tibial spurs more than half the length of the tarsi. Many are known from Europe and North America, as M. subcompletus of the former country, which is parasitic on various lepidopterous larve.

2. [L. c.] A member of this genus.

Microgasterinæ (mī-krō-gas-te-rī'nē), n. pl. [NL., ⟨ Microgaster + -inæ.] A large subfamily of Braconidæ, typified by the genus Microgaster, having the mesonotal sutures invisible and the large marginal cell reaching to the end

and the large marginal cell reaching to the end of the wing. There are many species, of 6 geners, the largest one of which, Apanteles, has 69 species in Great Britain alone. Their larvee parasitize many insects, especially lepidopterous larvee, issuing from the body of the host and spinning cocoons either singly or in mass. A glomeratus is an abundant parasite of the cabbage-worm, Pierie rapse, both in Europe and in North America.

microgeological (mi-krō-jē-ō-loj'i-kal), a. [<microgeolog-y + -ic-al.] Pertaining to microgeology; dependent on or derived from the use of the microscope in relation to geology: as,

of the microscope in relation to geology: as, microgeological investigations. microgeology (mi'krō-jē-ol'ō-ji), n. [⟨Gr. μι-κρός, small, + E. geology.] That department of the science of geology whose facts are ascertained by the use of the microscope. Microglossa (mī-krō-glos'ā), n. [NL., also Microglossus, Microglossum, ⟨Gr. μικρός, small, + γλῶσσα, the tongue: see glossa.] In ornith., a genus of cockatoos of the family Cacatuidæ, established by Geoffroy in 1809. It contains the great black cockatoos, as M. aterrimum, goliath, and alecto, all inhabitants of New Guinea and other islands of the Papuan region.

microglossia (mī-krō-glos'i-ä), n. [NL.,  $\langle$  Gr.  $\mu \kappa \rho \dot{\sigma}_{c}$ , small,  $+ \gamma \lambda \ddot{\omega} \sigma \sigma_{a}$ , the tongue: see glossa.]
Congenital smallness of the tongue.

Microglossidæ (mī-krō-glos'i-dē), n. pl. [NL.,  $\langle$  Microglossa + -idæ.] A family of psittacine birds, the black cockatoos: synonymous with Cacatuide

Microglossinæ (mī'krō-glo-sī'nē), n. pl. [NL., \( \) Microglossa + -inæ.] A subfamily of Cacatuidæ, represented by the genus Microglossa,

and containing the black cockatoos.

microgonidial (mi'krō-gō-nid'i-al), a. [( microgonidium + -al.] Of, pertaining to, or resembling a microgonidium.

microgonidium (mī'krō-gō-nid'i-um), n.; pl. microgonidia (-ξ). [NL., ζ Gr. μικρός, small, + NL. gonidium.] A gonidium of small size as compared with certain others produced by the same species.

The latter form [of Chlorococcum] is said to arise from the former by internal cell-division, which results in the production of "gonidis" of two sizes, the larger being termed macrogonidia, and the smaller microgonidia.

micrographist (mi-krog'ra-fist), n. [< micrography + -ist.] One who is skilled in micrography; a micrographer.
micrography (mi-krog'ra-fi), n. [= F. micrographie = Sp. micrograpia = It. micrograpia < Gr. μικρός, small, + -γραφία, < γράφειν, write. Cf. Gr. μικρόγραφεῖν, 'write small,' i. e. with a short vowel.] The description of objects too small to be discerned without the aid of a microscope.

Microhierax (mī-krō-hī'e-raks), n. [NL., ⟨Gr. μικρός, small, + ἰεραξ, a hawk, falcon: see Hierax.] A genus of very small hawks of the family Falconidæ, established by R. B. Sharpe in 11y Falconiae, established by R. B. Sharpe in 1874; the falconets; the finch-falcons. It contains the diminuitye species usually referred to the genus Hierax, which name is preoccupied in another department of zoology. The range of the genus includes southern Asia, Java, Sumatra, Borneo, etc. There are several species, as M. corrulescens, fringillarius, melanoleucus, and crythrogenys.

microhm (mik'rōm), n. [⟨Gr. μκρός, small, + E. ohm.] An electrical unit equal to the millionth part of an ohm.

Microliciem (mi krō-li-sī'ē-ē), n. pl. [NL. (Triana, 1871), < Microlicia + -ex.] A tribe of plants of the natural order Melastomacem and the suborder Melastomeæ, characterized by the cylindrical or angular capsule, conical or convex at the apex, by the connective often being produced below the anther-cells, and by

oblong or ovoid seeds. The tribe embraces 15 genera, Microlicia being the type, and about 250 species, all of which are found in tropical America.

microlite (mi'krō-līt), n. [ $\langle$  Gr.  $\mu$  $\kappa$  $\rho$  $\delta$  $_{\rm c}$ , small,  $+\lambda i\theta$  $\omega$  $_{\rm c}$ , stone: see -lite.] 1. A mineral related to pyrochlore, occurring in regular octahedrons having a brownish color and a resinous luster. to pyrochlore, occurring in regular octahedrons having a brownish color and a resinous luster. It is essentially a niobate of calcium. It was first found at Chesterfield in Massachusetts, in minute crystals (whence the name), later in Virginia in larger crystals sometimes weighing several pounds.

2. Same as microlith: an incorrect use. microliter (mi-krō-lē'ter), n. [⟨Gr. μικρός, small, + L. liter.] The millionth part of a liter. microlith (mi'krō-lith), n. [⟨Gr. μικρός, small, + λίθος, stone.] A name proposed by Vogelsang, in 1867, to designate the "microscopic acicular components of rocks"; a "microscopic individual" (Zirkel). The usage of later lithologists differs considerably in the application of this term.

saing, in 1607, to designate the "microscopic acicular components of rocks"; a "microscopic individual" (Zirkel). The usage of later lithologists differs considerably in the application of this term. By some it is regarded as the equivalent of crystallite, which is properly an aggregation of microscopic globular forms (globulites). By others crystallites are considered as differing from microliths in that the latter have the internal structure of true crystals, while in the former this cannot be recognized. Elongated or lath-shaped forms and such as resemble an hour-glass in shape are those now most generally designated as microliths; if curved or more or less twisted or hair-like, they are frequently called trichites. Microliths are most frequently seen in rocks of igneous origin, and are especially abundant as products of the devitrification of the glassy lavas. The feldspars, horblende, augite, and apatite are minerals most commonly found assuming this form.

microlithic (mi-kro-lith'ik), a. [⟨ Gr. μκρός, small, + λίθος, a stone, + -ic.] 1. Of or pertaining to or consisting of small stones: opposed to megalithic.

posed to megalithic.

Micromeria (mi-krō-mē'ri-ä), n. [NL. (Bentham), ζ Gr. μικρός, small, + μέρος, part.] A genus of labiate plants of the tribe Satureineæ genus of labiate plants of the tribe Satureinea and the subtribe Melissea. The calyx is tubular, commonly thirteen-nerved, and about equally five-toothed. The corolla is short, rarely experted from the calyx, bilabiate, the upper lip erect, flattish, entire, or emarginate, the lower spreading and three-parted. The flaments are arcuste-ascending, the anterior pair longer; the anthers are two-celled. The flowers are borne in whorls, axillary or crowded into a spike, or are sometimes single or cymose in the opposite axils. The species, numbering about 60, are low herbs or somewhat shrubby plants, sweet-odorous, of various habit, distributed pretty widely in the Old World, with a few in South America and the West Indies, and two or three in the United States. M. Douglassi is a well-known sweet-scented herb of California called yerba buena. M. obovata of the West Indies has been called allheal.

micromeric (mī-krō-mer'ik), a. [< micromere + Same as micromeral.

micromeritic (mi'krō-mē-rit'ik), α. [ζ μικρός, small, + μέρος, a part.] A term suggested by Vogelsang to designate a granitoid or thoroughly crystalline texture of a rock so fine as to be recognizable only with the aid of the microscope.

micrometer (mi-krom'e-ter), n. [= F. micromètre = Sp. micrómetro = Pg. It.micrometro, ζ Gr. μμορός, small, + μέτρον, measure.] An instrument for measuring microscopic lengths and angles. All micrometers depend upon two principles, magnification and oblique measurement. Magnification determines an angle by measuring the arc that subtends it upon a circle of large fixed radius, having its center coincident with the vertex of the angle. Thus, a mirror turning through a small angle may reflect a spot of light upon a distant scale. Oblique measurement (see diagonal scale, under diagonal) ascertains a length by measuring the distance at which it subtends a small fixed angle. Thus, the wedge-micrometer is a long wedge-shaped piece of metal or glass with its sloping sides as truly plane as possible, and graduated along its length. It is used to measure the distance between two points having a rigid circuitous connection, but a vacant space about the line between them. The wedge being thrust between the points, the distance it penetrates shows how far apart they are. The principle of oblique measurement is, in nearly all micrometers, applied under the form of a fine screw, the number of whose revolutions and parts of a revolution, in advancing from one point to another, measures the amount of this advance. In this case the pitch of the screw is the fixed angle, while the reading of the screw-head is proportional to the variable radius at which this angle is subtended by the length to be measured.—Annular or circular micrometer, a micrometer consisting, in its most approved form, of a disk of parallel plate glass, having in its center a round hole to the edges of which a ring of metal is cemented and afterward truly turned in a lathe. The disk being mounted in a brass tube, so that it may be accurately adjusted in the cous of the eyepicee and applied to a telescope, the metal ring is alone visible, and appears as if suspended in the atmosphere, whence the instrument is called the suspended annular micrometer. Brande and micrometer (mi-krom'e-ter), n. [= F. micrometre = Sp. micrometro = Pg. It. micrometro, ζ Gr. μικρός, small, + μέτρον, measure.] An instrument

micrometer-screw (mi-krom'e-ter-skrö), n. A screw attached to optical and mathematical instruments as a means of measuring very small angles. The pitch of the screw is made exceedingly small, while the graduated head is large, thus securing great ex-actness and simplicity in use.

micrometric (mi-krō-met'rik), a. [= F. micro-métrique; as micrometer + -tc.] Pertaining to the micrometer; made by the micrometer: as, micrometric measurements.

**micropod** (m' krọ-pod), n. A member of the Micropoda. Micropoda (mi-krop'ō-dä), n. pl. [NL.,  $\langle$  Gr.  $\mu\kappa\rho\delta\varsigma$ , small,  $+\pi\sigma\iota\varsigma$  ( $\pi\sigma\delta$ -) = E. foot.] In some systems, a division of monomyarian bivalves, comprising those which have the foot rudimentary or obsolete, as scallops, oysters, and the like.

like.

Micropodidæ (mī-krō-pod'i-dē), n. pl. [NL., <
Micropus (-pod-) + -idæ.] In ornith., a family
of fissirostral picarian birds; the swifts or Cypselidæ. See cut under Cypselus.

Micropodinæ (mī'krō-pō-dī'nē), n. pl. [NL., <
Micropus (-pod-) + -inæ.] In ornith., the typical swifts or Cypselinæ.

Micropodoideæ (mī'krō-pō-doi'dē-ē), n. pl.
[NL., < Micropus (-pod-) + -oideæ.] A superfamily of picarian birds composed of the swifts
and humming-birds, Cypselidæ and Trochildæ:

and humming-birds, Cypselidæ and Trochlidæ; Cypseliformes in a strict sense; Cypselomorphæ without the Caprimulgidæ.

microporphyritic (mi-krō-pôr-fi-rit'ik), a. [⟨Gr. μικρός, small, + E. porphyritic.] See porthyritic.]

pnyrite.

microprosopus (mī'krō-pro-sō'pus), n. [⟨Gr. μικρός, small, + πρόσωπον, face.] In teratol., a monster with an imperfectly developed face. micropsia (mī-krop'si-ā), n. [NL., ⟨Gr. μικρός, small, + ὁψις, view.] In pathol., an affection of the eye in which objects appear less than their actual size.

Microptera (mī-krop'ta-ā)

their actual size.

Microptera (mī-krop'te-rii), n. pl. [NL., neut. pl. of micropterus: see micropterous.] In entom.:
(a) The name given by Gravenhorst in 1802 to the rove-beetles (Staphylinidæ) and their allies, on account of the shortness of the wing-covers. They are now called Brachelytra. (b) A group of dipterous insects named by Robineau-Desvoidy in 1830. voidy in 1830.

woldy in 1850.

Micropterina (mi-krop-te-ri'nė), n. pl. [NL., (Micropterus + -ine.] A subfamily of Centrarchidæ, typified by the genus Micropterus. micropterous (mi-krop'te-rus), a. [< NL. mi-cropterus, < Gr. μικρός, small, + πτερόν, a wing, = E. feather.] Having short wings or fins.

E. feather.] Having short wings or fins.

Micropterus (mi-krop'te-rus), n. [NL.: see micropterous.] 1. In ichth., a genus of centrarchid fishes, the type of the subfamily Micropterine, established by Lacépède in 1802. There are two species, M. dolomieu and M. salmoides, or the small and large-mouthed black bass, both highly prized by sportamen and epicures. Bass of this genus are variously known as green, lake. moss., marsh., river., etc., bass; black. yellow, and jumping-perch, and trout-perch; black-trout, white-trout, southern or Roanoke chub, and by many other local or fanciful misnomers. Sometimes called Grystes. See cut at black-bass, 1.

2. In ornith., a genus of sea-ducks of the family Anatidæ and subfamily Fuligulinæ, named by Lesson in 1831. There is but one species, M. cine-

by Lesson in 1831. There is but one species, M. cinereus, the well-known steamer-duck of South America. The genus is now called Tachyeres, the name Micropterus being preoccupied in ichthyology.

3. In entom., a genus of coleopterous insects.

Micropuccinia

Micropuccinia (mi 'krō-puk-sin'i-ā), n. pl. [NL., < Gr. μακρός, small, + NL. Puccinia.]

A small group of tremelloid Uredineæ distinguished by Schroeter, in which only teleutospores are known, as in Puccinia Pruni and P. Asari. The teleutospores drop off when ripe, and only germinate after a long period of rest. See Uredineæ.

Micropus (mi'krō-pus), n. [NL., < MGr. μακρόπους, having small feet, < Gr. μακρός, small, + ποίς (ποό-) = E. foot.] 1. In ornith: (a) The typical genus of Micropodidæ: same as Cypselus. Meyer and Wolf, 1810. (b) A genus of short-footed thrushes or Brachypodinæ founded by Swainson in 1831, now referred to the Timeliidæ. It contains a number of Indian and Malayan species, as M. chalcocephalus, phasocephalus, melanocephalus, metanoleucus, and others. The genus is also called Microtarsus, Brachypodius, Prosecusa, and Isocherus.

2. In ichth., a name of two genera of fishes, one fecunded by I. F. Gren. 1831

tarius, Brachypodius, Prosecusa, and Izocherus.
2. In ichih., a name of two genera of fishes, one founded by J. E. Gray, 1831, the other by Kner, 1868.—3. In entom., a tropical American genus of lygseid bugs erected by Spinola in 1837. For a long time the destructive chinch-bug of the United States was called M. destructor, but it is now placed in the genus Ritesus.

micropylar (mi'krō-pi-lär), a. [(micropyle + -ar.] Pertaining to or having the character of

a micropyle.

micropyle (mi'krō-pil), n. [= F. micropyle,  $\langle$  Gr.  $\mu u \rho \phi_0$ , small,  $+\pi i \nu l n$ , gate, orifice.] I. In bot., the orifice or canal in the coats of the ovule to the apex of the nucleus, through beading to the apex of the nucleus, through which the pollen-tube penetrates. The name is also applied to the corresponding part of the seed, which indicates the position of the embryo. See foramen, 2. See cut under amphitropous.

2. In zool.: (a) The scar or hilum of an ovum at the point of its attachment to the ovary. (b) Any opening in the coverings of an ovum through which spermatozoa may gain access to the interior, or a cluster of minute pores on the surface of an egg through which fertiliza-tion is effected. On the eggs of lepidopterous insects these pores often form a rosette at one

end.

microrhabd (mi'krō-rabd), n. [⟨ Gr. μικρός, small, + NL. rhabdus, q. v.] A little rhabdus; a microsclere or flesh-spicule of a sponge in the form of a rhabdus. W. J. Sollus, Eneyc. Brit., XXII. 417.

microrhapmetrical (mi-krō-rō-ō-met'ri-kal), a.

Brit., XXII. 417.

microrheometrical (mi-krō-rō-ō-met'ri-kal), a.

[⟨ Gr. μικρός, small, + hoia, a flowing (⟨ heiν, flow), + μέτρον, a measure. Cf. rheometric.] Pertaining to a method of determining the nature of bodies in solution when flowing through small or capillary tubes.

Microrhynchus (mi-krō-ring'kus), n. [NL.,  $\langle$  Gr.  $\mu$ κρός, small, +  $\dot{\rho}\dot{\nu}\gamma \chi$ ος, snout, beak.] In mammal., a genus of woolly lemurs, of the subfamily Indrisinæ. The species is called M. laniger. See avahi.

Microsauria (mī-krō-sâ'ri-ā), n. pl. [NL., ζ Gr. μικρός, small, + σαῦρος, a lizard.] A group of labyrinthodont amphibians founded by J. W. Dawson upon the genera Dendrerpeton, Hyler-peton, and Hylonomus.

peton, and Hylonomus.

microsaurian (mī-krō-sā'ri-an), a. and n. [<
Microsauria + -an.] I. a. Pertaining to the
Microsauria, or having their characters.

II. n. A member of the group Microsauria.

microsclere (mī'krō-sklēr), n. [< NL. microsclerum, < Gr. μικρός, small, + σκληρός, hard.]

A flesh-spicule of a sponge. Microscleres are
generally of minute size, and serve usually for
the support of a single cell.

microsclerous (mī-krō-sklē'rus), a. [As microsclere + -ous.] Having the character of a microsclere.

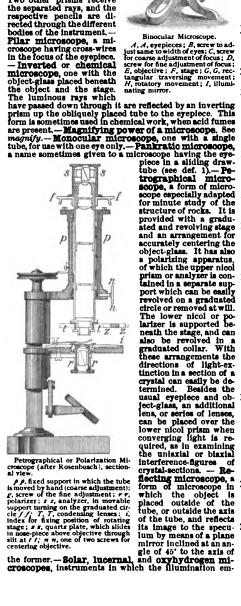

crosclere.

sciere + -ous.] Having the character of a microsclerum (mī-krō-sklē'rum), n.; pl. microsclera (-rā). [NL.] Same as microsclere.

microscope (mī'krō-skōp), n. [= F. microscope = Sp. Pg. It. microscopio, < NL. microscopio, < Gr. μικρός, small, + σκοπείν, view.] 1. An optical instrument consisting of a leus or combination of lenses (in some cases mirrors also) which magnifies and thus renders visible minute objects that cannot be seen by the naked eye, or enlarges the apparent magnitude of small visible bodies, so as to render possible the examination of their texture or structure. The single microscope, which is the simplest form, is merely a convex lens, near to which the object to be examined is placed; it is also called a magnifying-lens, under lens). The compound microscope consists essentially of two lenses, or systems of lenses, one of which, the object-glass or objective, forms an enlarged inverted image of the object, and the other, the eyeplece or ocular, magnifies this image. The eyeplece and objective (see these words) are placed at the opposite ends of the tube or body, which is often made of two closely fitting

parts so that its length (and thus the distance between the glasses) can be varied at will; it is then called a draw-tube. The object under examination is placed upon a support, called the stage, beneath the objective; its position upon this may be adjusted by the hand, or, better, the object and the stage (then called a mechanical stage) are moved together by some mechanical arrangement, as, for example, by two screws giving motions in two directions at right angles. The proper distance between the objective and the object (such that the image of the latter shall be seen clearly, or be in focus) is usually attained by the movement of the tube as a whole. This is accomplished by the rapid motion of the coarse adjustment, and more alowly and accurately, as is necessary in the case of high powers, by an arrangement called the slow motion or fine adjustment. The necessary illumination is obtained by a concave mirror below the stage, which reflects the light upon the object. An achromatic condenser, usually in connection with a diaphragm, is often added to converge the light more strongly; for opaque objects a bull's-eye condenser, a lieberkuhn, or some other form of reflector is employed. The body of the microscope, with the stage, etc., is supported firmly upon a stand, and usually attached by a joint which allows of its being inclined at any desired angle between the vertical and horizontal positions. Many accessories, or special devices applicable to particular uses, may be added to the microscope in its essential form, as a micrometer, polarizing prisms, camers lucids, etc. The compound microscope itself often varies widely in construction, according to the character of the work for which it is to be used. (Compare also the phrases below.)

2. [cap.] A constellation. See Microscopium.—Achromatic microscope, a microscope having cross-wires widely in constructed that the object under examination can be viewed simultaneously by both eyes, with the advantage objective, but two tubes, each with its own experience.

ployed comes from the sun, a lamp, and an oxyhydrogen lime-light respectively.

microscope-lamp (mī'krō-skōp-lamp), n. A special form of lantern, usually provided with a reflector, a bull's-eye lens, and a metallic chimney lined with some poor conductor of heat.

Means are provided for adjusting the lamp in any position in order to throw the light upon the object under examination.

amination.

microscopic (mī-krō-skop'ik), a. [< F. microscopique = Sp. Pg. It. microscopico, < NL. microscopicus, < microscopium, microscope: see microscope.] 1. Pertaining to a microscope, or having its character or function; adapted to the purposes of a microscope, or to the inspection of minute objects: as, a microscopic lens, eyepiece, or stand; microscopic sight or vision.

Why has not man a microscopic eye?

Why has not man a microscopic eye?
For this plain reason, man is not a fly.
Pope, Essay on Man, i. 193.
Such microscopic proof of skill and power
As, hid from ages past, God now displays.
Couper, Tirocinium, 1. 637.

The present limit to microscopic vision is simply the goodness of the objective.

Amer. Jour. Sci., 2d ser., XLVIII. 172.

Amer. Jour. Sci., 2d ser., XIVIII. 172.

2. Of minute size; so small as to be invisible or indistinct to the naked eye; adapted to or prepared for examination by the miscroscopic as, microscopic creatures or particles; a microscopic object.—3. Made or effected by or as if by the aid of a microscope; hence, relating to things of minute size or significance; infinitesimal; petty: as, microscopic observations or investing the property of the pro gations; microscopic criticism.

So far as microscopic analysis would enable us to decide this question. Todd and Bournan, Physiol. Anat., II. 301.

4. Characteristic of the microscope or its use: as, to observe anything with microscopic minuteness; microscopic definition of an object.—
5. Employing or working with a microscope, or as if with a microscope.

The tree that has stood for centuries bears to the micro-copic investigator marks of every winter that has passed ver it. Stubbs, Medieval and Modern Hist., p. 108. over it.

Also microscopical.

Also microscopical.

Microscopica (mī-krō-skop'i-kā), n. pl. [NL., neut. pl. of microscopicus: see microscopic.] In zoöl., microscopic animals; microzoans: applied to infusorians, rotifers, and other animalcules.

microscopical (mī-krō-skop'i-kal), a. [< microscopic + -al.] Same as microscopic.

microscopically (mī-krō-skop'i-kal-i), adv. [< microscopical + -ly².] In a microscopic manner or degree; by means of, or so as to require the use of, the microscope: as, to examine a plant microscopically; an object microscopically small.

microscopist (mī'krō-skō-pist). n. [< F mi-

ly small.

microscopist (mī'krō-skō-pist), n. [< F. microscopiste = It. microscopista; as microscope++ist.] One skilled or versed in microscope; one who makes use of the microscope.

Microscopium (mī-krō-skō'pi-um), n. [NL.: see microscope.] A constellation south of Capricorn, introduced by Lacaille in 1752.

microscopy (mī'krō-skō-pi), n. [= F. microscopie = Sp. microscopia; as microscope; investigation with the microscope: as, to be skilled

microsection (mi-krō-sek'shon), n. [⟨Gr. μι-κρός, small, + E. section.] A slice, as of rock, cut so thin as to be more or less transparent, and mounted on a glass in convenient form to be studied with the aid of the microscope.

microseism (mi'krō-sism), n. [⟨Gr. μικρός, small, + σεισμος, a shaking.] A slight or weak earthquake-tremor.

We may feel sure that earth-tremors or microscisms re not confined to countries habitually visited by the rosser sort of earthquakes.

G. H. Darwin, Pop. Sci. Mo., XXXI. 368.

microseismic (mī-krō-sīs'mik), a. [< microseism + -ic.] In seismology, of, pertaining to, or of the nature of microseisms, or very slight earthquake-tremors.

Should microscimic observation enable us to say when and where the minute movements of the soil will reach a head, a valuable contribution to the insurance of human safety in earthquake regions will have been attained.

J. Milne, Earthquakes, p. 804.

microseismical (mī-krō-sīs'mi-kal), a. [< mi-croseismic + -al.] Microseismic.

A series of microseismical observations.

J. Milne, Earthquakes, p. 316.

microseismograph (mī-krō-sīs'mō-grāf), n. [ζ Gr. μικρός, small, + σεισμός, a shaking, + γράφειν, write.] An instrument for measuring and recording very slight earthquake-shocks or earthmicroseismometry (mi'krộ-sīs-mom'et-ri), n. [ $\langle$  Gr. μικρός, small, + σεισμός, a shaking, + -με-τρία,  $\langle$  μέτρον, a measure.] The measurement or observation of slight earth-tremors.

The account that is given of the labours of Italian ob-rrers in the field of microseismometry is meagre and un-tisfactory. Nature, XXXIX. 888. servers in th satisfactory.

microseme (mī'krō-sēm), a. [⟨Gr. μκρός, small, + σημα, mark, sign: see sema.] In craniom., having an orbital index below 84.

The skulls agree with the ordinary Bushman skull in most respects, being microseme.

A. Macalister, Jour. Anthrop. Inst., XVI. 150.

microseptum (mī-krō-sep'tum), n.; pl. microseptu (mī-krō-sep'tum), n.; pl. microsepta (-tā). [NL., < Gr. μικρός, small, + NL. septum, q. v.] A small imperfect or sterile septum or mesentery of an actinozoan. See macrosentum.

microsiphon (mī-krō-sī'fon), n. See siphon and

microsiphonula.
microsiphonula (mī'krō-sī-fon'ū-l\bar{e}), n.; pl.
microsiphonulæ (-l\bar{e}). [NL., \ Gr. μικρός, small,
+ σίφων, a tube, pipe: see siphon.] The larval
stage of certain cephalopods, as ammonoids,
nautiloids, and belemnoids, during which the
small tubular siphon or microsiphon makes its
appearance. Hyatt, Proc. Bost. Soc. Nat. Hist.,
1887.

microsiphonular (mi'krō-sī-fon'ū-lär), a. [< microsiphonula + -ar3.] Of or pertaining to a microsiphonula

microsiphonulate (mī\*krō-sī-fon'ū-lāt), a. [<microsiphonula + -ate¹.] Provided with or characterized by a microsiphon. Amer. Nat., XXII 278

microsiphonulation (mī'krō-sī-fon-ū-lā'shon),

n. [< microsiphonula + -ation.] The formation or the possession of a microsiphon; the state of being microsiphonulate. Amer. Nat.,

XXII. 878.

microsoma (mi-krō-sō'mā), n.; pl. microsomata (-ma-tā). [NL., ⟨ Gr. μκρός, small, + σῶμα, body.] A little body or corpuscle; one of the minute granules embedded in the hyaline plasm of the protoplasm of vegetable cells, and constituting an essential portion of its substance. These granules have a high degree of refringency, and are very deeply stained by hematoxylin.

microsome (mī'krō-sōm), n. [⟨ NL. microsoma.] Same as microsoma. Nature, XXX. 183.

microsomia (mī-krō-sō'mi)

183.

microsomia (mī-krō-sō'mi-ā), n. [NL., < Gr. μικρός, small, + σῶμα, body. Cf. microsoma.]

The state of being dwarfed; dwarfishness.

microsomite (mī-krō-sō'mīt), n. [< microsoma + -ite².] One of the smaller permanent or definitive somites or metameres of which an animal body may be composed; a secondary segment, succeeding the primary segments or macrosomites.

microsomitic (mī'krō-sō-mit'ik), a. [< microsomite + -ic.] Having the character of a microsomite; relating to microsomites. Amer. Nat.,

Vesuvius.

Microsorex (mī-krō-sō'reks), n. [NL., < Gr. μικρός, small, + L. sorex = Gr. ὑραξ, a shrewmouse.] A genus of very small North American shrews, of the family Soricidæ and subfamily Soricinæ, having 30 teeth. S. hoyi is the typical species. Coues, 1877.

microspectroscope (mī-krō-spek'trō-skōp), n. [⟨Gr. μικρός, small, + E. spectroscope.] A combination of the spectroscope with the microscope, by the use of which it is possible to examine the absorption-bands in minute quantities of a substance. The arrangement ordinarily

amine the absorption-bands in minute quantities of a substance. The arrangement ordinarily employed consists of a series of glass prisms in a small tube which is attached above the achromatic eyepiece.

Microsperma (mī-krō-sper'mē), n. pl. [NL. (Bentham and Hooker, 1883),  $\langle$  Gr.  $\mu \kappa \rho \delta_c$ , small,  $+ \sigma \pi \ell \rho \mu a$ , a seed.] A series of monocotyledonous plants, characterized by a perianth which is corolla-like, at least on the inside, by an inferior ovary which is one-celled with three parietal placentæ, or rarely three-celled with axillary placentæ, and by numerous very small seeds. The series embraces three orders. Hudrocharides seeds. The series embraces three orders, Hydrocharideæ (the frog's-bit family), Burmanniaceæ, and Orchideæ (the orchid family), including about 5,090 species, 5,000 of which belong to Orchideæ.

Microsphæra (mī-krō-sfō'rā), n. [NL. (Leveillé, 1851),  $\langle$  Gr.  $\mu$ u $\rho$ 6 $\rangle$ 6, small, +  $\sigma$ 4 $\sigma$ 1 $\rho$ 0, a sphere.] A genus of parasitic pyrenomycetous

fungi of the group Erysipheæ. The perithecium, which contains several asci, has several appendages radiating from it like the spokes of a wheel. These appendages are free from the mycelium, and are more or less dichotomously branched at the tips, often in a very beautiful manner. About 50 species are known, of which nearly 20 occur in North America. M. Ravenelii is injurious to the honey-locust (Gleditechia); M. aini (the M. Friezii of authors) occurs on various species of Canothus, Viburnum, Ulmus, Syringa, Platanus, Jugtans, and Carya; and M. quercina is found on various species of oak. See Erysipheæ.

microsporangiophore (mī 'krō-spō-ran' jī-ō-fōr), n. [⟨ NL. microsporangium, q. v., + Gr. -φόρος, ⟨φέρειν = E. bear¹.] The foliage-leaves which surround or protect the spore-bearing leaves of certain hypothetical archaic cryptogams, and from which the flower of flowering plants may have been evolved plants may have been evolved.

The origin of this primeval flower from a somewhat fern-like Cryptogam, of which the foliage-leaves, the envelopes of the spore-bearing leaves, the micro- and macro-sporangiophores, had become permanently differentiated in ascending order.

Geddes, Encyc. Brit., XVI. 846.

microsporangium (mi'krō-spō-ran'ji-um), n.; pl. microsporangia (-జ). [NL., ⟨Gr. μικρὸς, small, + NL. sporangium, q. v.] A sporangium containing microspores: the homologue of the pollen-sac in phanerogams.

microspore (mi'krō-spōr), n. [= F. microspore,  $\langle$  Gr.  $\mu \kappa \rho \phi_{\mathcal{C}}$ , small,  $+ \sigma \pi \delta \rho o_{\mathcal{C}}$ , a seed.] 1. In bot., an asexually produced spore of small size as compared with others produced by the same species: the homologue of the pollen-grain of phanerogams.

In some of the living club-mosses there are two kinds of spores, one being much larger than the other. The larger are known as macrospores, whilst the smaller are called microspores.

Huzley, Physiography, p. 241.

2. In zoöl., one of the spore-like elements, of exceedingly minute size, but very numerous, produced through the encystment and subsequent subdivision of many monads.

microsporine (mī-krō-spō'rin), a. [< microspore + -ine¹.] Noting one of the two kinds of microbes reported by Klebs to be uniformly present in diphtheria. They are micrococcoid in form and are found chiefly upon the tonsils, and mark a less serious phase of the disease. The accuracy of these conclusions has been questioned.

Microsporon (mi-kros'pō-ron), n. [NL., < Gr.

conclusions has been questioned.

Microsporon (mi-kros'pō-ron), n. [NL., ⟨Gr. μικρός, small, + σπόρος, seed.] A genus or class of fungi producing various skin-diseases. M. furfur, which produces pityriasis versicolor, consists of hyphe having long articulations intermixed with round spores, and grows between the cells of the epidermis, effecting their rapid degeneration. M. Audouin, so called, produces pelade, another skin-disease. According to Grawitz, however, these forms, as well as those described as Achorion, the fungus of favus, and Trichophylon, the fungus of tinea, are all the same thing, only differing from one another in size. This difference is attributed to differences in the food. The M. diphthericum of Klebs is a micrococcus.

microsporophyl, microsporophyll (mī-krō-spō'rō-fil), n. [⟨ Gr. μικρός, small, + σπόρος. seed, + φιλλον, leaf.] The leaf-bearing microsporangium of the heterosporous Pteridophyta: the homologue of the stamen in phanerogams. microsporous (mī'krō-spō-rus), a. [⟨ microspore + -ous.] Resembling or derived from a microsporous microspore.

microsthena (mī-kros'the-nā), n. pl. [NL., < Gr. μμκρός, small, + σθένος, strength.] In J. D. Dana's classification, the third order of Mammalia, composed of the chiropters, insectivores, rodents, and edentates. The Microsthena correspond to the Lisencephala of Owen, and to the ineducabillan series of placental mammals of Bonaparte and Gill. microsthena (mī'krō-sthēn), n. A member of the order Microsthena.

microsthenic (mī-krō-sthen'ik), a. [< Microsthena + -ic.] Pertaining to or characteristic of the Microsthena.

J. D. Dana, Cephalization, p. 9.

Microstoma (mī-krō-sthēn), n. [NL., < Gr. microtomical (mī-krō-tom'ik), a. [< microtome of the microtomic or thin slices; relating to the use of the microtomic. Amer. Nat., + στόμα, mouth.] 1. G. H. Lewes, Probs. of Life and Mind, II. ii. § 82.

=Syn. 1. Center, Midst, Middle. Center is a precise word, ordinarily applied to circular, globular, or regular bodies: as, the center of a circle, globe, field; but it is used wherever a similar exactness appears to exist: as, the center of a crowd. Midst regards the person or thing as enveloped or surrounded on all sides, especially by that which is close upon him or it, thick or dense: as, in the midst of the forest, the waves, troubles, one's thoughts. Except as thus modified by the idea of envelopment or close environment, the old idea of midst as meaning the middle point (see Gen. i. 6; Josh. vii. 23; 1 Ki. xxii. 35) is quite obsolete. Midst is very often used abstractly or figuratively, center rarely, middle never. Midsle is often applied to extent in only one direction: as, the midsle of the street, of a block of houses, of a string; it is often less precise than center: compare the center and the middle of a room.

That in their midst, in our midst, &c., are at odds with the genius of our language, is an assertion somewhat adventurous. As concerns a substantive, its subjective genitive, very often, may be expressed prepositively. Love of God, inending 'love emanating from God,' may be exchanged for God's love but we also say, Plato's commentators, and the world's end. To come to possessive pronouns, we have no scruples about the objective do his pleasure, sing thy praise, in my absence, on your account, to their discredit, in our despite, his equal, &c., &c.; and with these phrases in our midst is rigidly comparable. . . With reference to analogical principles in our midst is altogether irreproachable.

pretty, gracefully pleasing: see minion¹.] 1. A well-known plant, Reseda odorata, native in northern Africa. Its racemes of small greenish-white flowers with prominent brown anthers are not showy, but the plant is a universal favorite in gardens on account of its fragrance. In ordinary culture it is an annual, but it is naturally shrubby, and by proper care can be made to thrive for several years in the form of tree-mignonette. The perfume is best extracted by enfleurage.

2. Some other species of the genus Reseda. The white mignonette, R. alba, a tall plant with white scentless blossoms, has sometimes been cultivated. =Syn. Migrate, Emigrate, Immigrate. To migrate is to change one's abode, especially to a distance or to another country, emphasis being laid upon the change, but not upon the place of departure or that of stopping, and the stay being generally not permanent. Emigrate, to imparte from, views the person as leaving his previous abode and making a new home; immigrate, to migrate into, views him as coming to the new place. The Arab migrate; the European coming to America is an emigrant to those whom he leaves, and an immigrant to the Americana. Migrate is applicable to animals; the other terms are generally used of the movements of men.

migration (mi-grā'shon), n. [< F. migration = Pg. migração = It. migrazione, < L. migration = Pg. migração = It. migrazione, < L. migration = pg. migrate.] 1. The act of migrating; change of residence or habitat; removal or transit from one locality or latitude to another, especially at a distance. Among animals, the most extensive and regular migrations are performed by birds during spring and fall, and in a general way along meridians of longitude, the vernal migration being northward, the autumnal southward. This is ordinary or equatorial migration. Bome, as sandpipers, which breed only in high latitudes, may be dispersed during their migration over a great part of the world. Others, as swallows, are noted not only for the extent but for the rapidity and regularity of their movements, their arrival and departure being capable of prediction with considerable accuracy. The migration of many water-fowls is scarcely less notable in the same respects. Migration seems to be determined, primarily and chiefly, by conditions of food-supply, but this does not fully account for the apparently needless extent and the wonderful periodicity of the movement, nor for the fact that individuals sometimes return to exactly the same respect to breed again, after

the southern United States. The faculty which enables or compels animals to migrate has been named the "instinct of migration"; but the phrase is rather a statement of fact than an explanation of the phenomenon, except in so far as this instinct may be regarded as originating in and being highly developed from the simple necessity of moving about to secure food.

All our adventures were by the fireside; and all our adjustions from the blue bed to the brown.

Goldsmith, Vicar.

Our remote forefathers must have made endless earlier migrations as parts of the great Aryan body, as parts of the amalier Teutonic body. But our voyage from the Low-Dutch mainland to the isle of Britain was our first migration as a people. E. A. Freeman, Amer. Lecta, p. 31.

2. A number of animals migrating together; the total of the individuals or species which perform any particular migration; also, the time or period occupied in migrating.—3†. Change of place; removal.

Such alterations, transitions, migrations, of the centre of gravity, and elevations of new islands, had actually happened. Woodward, Essay towards a Nat. Hist. of the [Earth. (Latham.)

of the suborder Tubulifora, the tribe Eupatoof the suborder Tubulifloræ, the tribe Eupatoriaceæ, and the subtribe Agerateæ. The principal characteristics are an involucre of four slightly unequal bracts, four-flowered heads which are racemed or panicled, and pappus with very numerous scabrous bristics arranged in one row. The plants are shrubs or herbs, which are almost always climbing or twining, with opposite leaves, and small white, flesh-colored, or pale-yellowish heads. About 140 species have been enumerated, but they may probably be reduced to 100. They are natives of the warmer parts of America, with the exception of one species, which is found in Asia and tropical Africa. M. scandens, the climbing hempweed, is a high twiner, with cordate somewhat deltoid or hastate leaves and heads of pale flesh-colored flowers in dense cymes, climbing over copses along streams; it ranges through the eastern and southern United States into Mexico and to Brazil. A white or bluish-white liquid secreted by the mammary glands of the females of the class Mammalia. and drawn from their breasts for the nourish-

ry glands of the females of the class Mammalia, and drawn from their breasts for the nourishment of their young. It is opaque, with a slight peculiar odor and a bland sweetish taste. Its chemical constituents in different mammals are qualitatively alike, but quantitatively vary much, not only in different species, but also in different individuals, or even at different times in the same individual. The amount of water varies from about 30 to 90 per cent., the residue being composed of abuminoids (casein and lactoprotein), fat, milk-sugar, and certain salts, chiefly phosphates. Under the microscope it appears as a clear transparent fiuld, in which a large number of minute globules are suspended. When allowed to rest, these globules rise to the surface, forming a yellowish stratum, the cream, which consists maining of the fat, mixed with some casein, and retaining some serum. In the cow about 5 per cent. of the milk is cream, in the human female less, in the mare scarcely more than 1 per cent. By churning, the globules unite to form butter, leaving the buttermill, which his essentially a solution of milk-sugar, with the salts and some casein and butter. The milk from which cream is separated is skimmed milk, which when left to itself (if not too cold) develops, from the action of a certain bacterium, lactic acid, which separates the casein in a coagulated condition called curds; the same effect is produced by some other acids, and by rennet, the prepared inner membrane of the stomach of a calf. The liquid separated from the coagulum is called uchey, and contains chiefly

milk-sugar and some salts. Cheese is prepared by coagulating milk with rennet, allowing the whey to separate, and adding salt to the curd. The specific gravity of both cow's and human milk is about 1.080. Human milk is alloways alkaline, cow's milk either alkaline or acid, while the milk of carnivora is always acid. Milk represents a complete or typical food, in which all the constituents necessary for maintaining the life and growth of the body are present. In rare instances milk, in greater or less abundance, is secreted by the mammary glands of the adult human male.

1. A mechanical device for grinding grain for
food. Ancient mills, and those still in use in uncivil-

an "under-runner,"
while an "upperrunner" is one like
that shown in the
cut. The bush, g,
in the bedstone is
fastened in its
place by wedges.
The balance-rynd, 3, busk.
J, is a curved bar which crosses the eye or central opening of the runner on the under side at the margin of
the eye and supports the stone. The supporting bearing of the balance-rynd is a central socket called a cockeye, and the supporting point of the
spindle which fits the cockye is
called the cockhead. The spindle,
balance-rynd, and runner-stone are
raised or lowered by means of the
bridge-tree and lighter-screw to adjust the runner properly in relation
to the bedstone. The hopper, p, receives the grain to be ground, and delivers it to the shoe, which is loosely
supported, and kept constantly vibrating by the rotation of the damsel,
a sort of trundle-wheel, the trundles
of which chatter against the shoe.
Flour is also made by cylinder-mills
of one roller act toward the cutting edges of the other.

Much water goeth by the mill that the miller knoweth not of.

J. Heywood, Proverbs (1546), ii. 5.

Two women shall be grinding at the mill. Mat, xxiv. 41. 2. A machine for grinding or pulverizing any

solid substance. The word in this use is generally in composition with a word denoting the purpose for which the mill is designed: as, paint-mill, quartz-mill, coffee-mill.

One could see by the way he ground the coffee in the mill nailed to the wall that he was reckless of the results.

W. M. Baker, New Timothy, p. 294.

3. A machine which transforms raw material by a process other than grinding into forms fit for uses to which the raw material is unfitted. In this use also the word is generally in composition, as eauc-mill, planing-mill, etc. This use of the word is, how-ever, limited and arbitrary, many machines which trans-form raw materials not being called mills.

4. A machine which does its work by rotary

motion, especially a lapidary wheel.—5. A treadmill. [Colloq.]

A few weeks after I was grabbed for this, and got a month at the mill; but I was quite innocent of prigging.

Quoted in Mayhew's London Labour and London Poor,

6. (a) A building in which grinding is done: often in composition: as, a flour-mill, water-mill, windmill, etc. (b) In metal., any establishment in which metalliferous ores are treated in the in which metalliferous ores are treated in the moist way, as by stamping and amalgamating, by grinding in pans, or by similar methods. Those works in which the reduction is performed by the aid of fire are usually designated smelting-works, or sometimes (especially in the case of iron) furnaces. In the manufacture of iron a mill is an establishment where the metal in the rougher form (that is, in that of blooms, alabs, rough bars, etc.) is worked up into various kinds of merchantable iron, or into those forms which are desired by the different classes of consumers of the metal, such as ralls, plates, merchant bars, and many other similar products. (c) A large building used as a factory, and occupied by machinery for the purposes of manufacture: as, a silk-mill; a cotton-mill.

7. In calico-printing or bank-note engraving, a soft steel roller which receives under great pressure an impressed design in relief from a pressure an impressed design in relief from a hardened steel engraved roll or die, and which is used in turn, after being hardened, to impart the design in intaglio to a calico-printing roll or note-printing plate.—8. [Cf.  $mill^1, v., 1.$ ] A snuff-box. Also mull. [Scotch.]

As soon as I can find my mill, Ye'se get a snuff wi' right guid will. Picken, Poems, I. 117. (Jamisson.)

He plucked forth a huge horn snuff-box, or mull, as he called it, and proffered me. Scott, Rob Roy, vi.

9. A kind of screw-press introduced during the reign of Elizabeth into England from France, and designed to supersede the manufacture of and designed to supersede the manufacture of gold coins by the primitive method of striking dies with a hammer. It was introduced in 1561, discontinued in 1572, reintroduced in 1656 and 1658, and permanently adopted shortly after the restoration of Charles II. The more modern coining-press has supplanted this machine. The mill not only struck the legend, but also raised the rim on the margin and serrated the edge. These serrations were at first straight; but, having been found easy to imitate by filing, they were made curvilinear in the reign of George II.

Barker's mill, an ingenious machine, moved by the centrifugal force of water, invented by Dr. Barker. It consists of a vertical axis CD, moving on a pivot at D, and carrying the upper milistone m, after passing through an opening in the fixed milistone n. Upon this vertical axis is fixed a vertical tube TT, communicating with a horizontal tube AB, at the extremities of which, A and B, are two apertures in oppo-

communicating with a horizontal tube AB, at the extremities of which, A and B, are two apertures in opposite directions. When water from the milli-course MN is introduced into the tube TT, it flows out of the apertures A and B, and by the pressure of the water on the parts of the tube opposite the apertures the arm AB, and consequently the whole machine, is put in motion. The bridge-tree ab is elevated or depressed by turning the nut c at the end of the lever cb. The grain to be ground is poured into the hopper H. As modified by Whitelaw it is used in Great Britain under the name of Scotch turbine. See turbine.—Cannon-ball mill. See cannon-ball.—Chilian mill, a form of mill consisting of two heavy wheels or rollers, set parallel on a horizontal shaft, and having a double rotation, that on the horizontal shaft, and a second around a vertical axis controlling the horizontal shaft, and a second around a vertical axis controlling the horizontal shaft, is of much antiquity, is now used especially for grinding cleaginous seeds, nuts, fruits, etc. See arrastre.—Cone-and-cradle mill, a mill having a conical muller or grinder reciprocating in a semicylindrical concave or bed. E. H. Knipht.—Crooke's mill, an occasional name for Crooke's radiometer (which see, under radiometer).—Edge-runner mill, a mill in which the millstones grind by their peripheral surfaces instead of by their flat surfaces. The stones are generally two in number (though a single one is sometimes used), and run in a circular trough provided with a bottom of stone or of iron. The trough holds the material to be ground. The stones are pivoted to the ends of an axie like cart-wheels, and the axie is attached in the middle to a vertical shaft which rolls the stones around in the trough,

thus effecting both a rolling and a rubbing action upon the material to be ground. Such mills are used for grinding finasced preparatory to expressing the oil, in iron-foundries for grinding sand and clay, and for other purposes.—Horisontal mill, a mill having the acting surfaces in a horizontal plane at right angles to the vertical axis of the revolving stones, as in a grain-grinding mill.—Hydraulic, lapidary, etc., mill. See the adjectives.—Levigating mill. See levigate!.—Mouse mill, a combined electromagnetic engine and induction electrical machine used for feeding forward the paper record-ribbon, and for electrifying the ink, in Thomson's siphon-recorder for submarine telegraphy.—Revolving mill, a form of Chilian mill in which the pan turns while the axis of the rollers does not change its position; a revolving-pan mill.—To bring grist to the mill. See grist.—Togo through the mill. See go.

mill! (mil), v. [< mill!, n.] I. trans. 1. To grind in a mill; grind; reduce to fine particles or to small pieces by grinding or other means. See milling.

See milling.

2. To subject to the mechanical operations car-2. To subject to the mechanical operations carried on in a mill, as a saw-mill or planing-mill; shape or finish by machinery. Specifically, in ceram., to prepare (the clay) by passing it through a mill, which is usually of the form of an inverted cone, in the center of which is a vertical shaft set with knives. The clay, being thrown in at the top, is kneaded, cut, and pressed by the revolution of the shaft, and when it emerges from the bottom is plastic and ready for molding. See pugmill.

Lumbermen charge the consumer for the full measurement of the boards [for floors] before they are milled.

Art Age, IV. 46.

3. To cut (metal) with a milling-tool in a milling-machine.—4. To turn or upset the edge of (a coin) so as to produce a marginal ridge or flange on both sides, upon which, when laid flat, the coin rests, thus protecting the design which is inside of the flange from wear, and enabling the coins to lie firmly when piled together one upon another.—5. To flute the edge of, as of a coin, or of any flat piece of metal, as the head of a milled screw or the rim of a metal box-cover, to afford a hold for the fingers. The screws of optical and surgical instruthe fingers. The screws of optical and surgical instru-ments, and other philosophical apparatus, and also the covers of lubricators for machinery, are commonly milled.

Wood's halfpence are not milled, and therefore more saily counterfeited. Swift, Drapier's Letters, iii. 6. To tumble (leather) in a hollow revolving cylinder in contact with oil or any ameliorat-ing or tanning liquid, whereby the liquid is worked into all parts of the leather.

Twenty-five sides [of leather] being placed in the wheel one time and . . . gambler liquor poured over them . . in this wheel they are milled for about ten minutes. Davies, Leather, p. 497.

7. To throw, as undyed silk. Encyc. Dict.—8. To thicken by fulling; full (cloth), as in a fulling-mill.—9. To yield, in the process of grinding or milling.—10. To beat severely with the fists; fight. [Slang.]

In the early church the doctrine of millens-rianism (chiliasm) was generally held, and many, both of the otherwise orthodox and of heretics, were accused of holding it in a literal or even a gross and sensual sense. Thus, after the fourth century it fell into general disfavor. As A. D. 1000 approached there was a wide-spread panic throughout Europe, under the idea that the prophetic thousand years had expired and that Satan would be let thousand years had expired and that Satan would be let close. G. Raictinson, Origin of Nations, I. 151.

Specifically—2. In theol., a period during which the kingdom of Christ will be established upon the earth and will predominate over all upon the earth and will predominate over all other authority. The phrase "a thousand years," in Rev. xx. 1-5, has been understood literally, or (on the principle that in Sortpure prophecies a day stands for a year, and the Jewish year contained 360 days) as representing 360,000 years. It is generally regarded as indicating an indefinite but long period, and bellet in such a period is universal in the Christian church. But whether this predominance of the kingdom of Christ will be accomplished gradually by the gospel, and will precede Christ's second coming, or will follow his second coming and be accomplished by it, is disputed. This question divides theologians into two schools, the postmillenarians, who hold the former view, and the premillenarians, who hold the latter; while many hold that the millennium represents the gospel dispensation or reign of the church, and has accordingly already prevailed for many centuries.

The millepores were long supposed to be corals, and such is their appearance and the part they play in the formation of reefs. They belong, however, to a different class of animals, the Hydrozoa (not Actinozoa), being among the few members of their class which form a hard calcareous polypary or polypidom like the stone-torals, and the leading representatives of the order called Hydrocorallinæ (which see). The incrusting substance forms a dense deposit upon the outer surface of the ramified hydrosome. There are two kinds of zooids or polypites: short broad alimentary zooids (gastrozooids) with 4 or 6 tentacles, surrounded each by a zone of from 5 to 20 or more long mouthless zooids (dastylozoids) with numerous tentacles, having no ampullæ. The zooids are dilated at their bases, and there give off tubular processes which ramify and inoscalte, giving rise to a thin hydrozone.

2. One of several other grasses: generally with a prefixed descriptive. See below.—Arabian or evergreen millet, a variety of Indian millet. [Local, U. S.] — Cat-tail, East Indian, Egyptian, pearl millet, in the southern United States, a tail grass, Pennisetum spicatum, there cultivated as a forage-plant. In India it serves as a cereal.—German, Hungarian millet, set serves as a cereal.—German, Hungarian millet, a stout cereal grass commonly known as Sorghum vulgare, but now regarded as part of a multiform species, Andropogom Sorghum, which includes among its varieties the common broom-corn and sorghum. It is extensively cultivated in the Mediterranean region and the Orient, occupying the place of a staple grain. The seed properly treated makes a bread of good quality, and is a good grain for quadrupeds and fowls. The plant serves also for green fodder. This is the durra or doura of Africa and India. It has been introduced to some extent into the United States, where it is sometimes called coffee- or chocolate-corn, because of its attempted use as a substitute for coffee. Also called puinca-corn, kafir-corn.—Italian millet, Sctaria Italica, originally an Asiatic grass: its variety Germanica is known as German or Hungarian millet and Bengal or Hungarian grass. (See grass.) Its seeds are suited to cage-birds and fowls, and it is to some extent used as a food-grain; in America it is raised mostly for forage.—Millet coda or khoda, the grain of Paspalum scrobiculatum, an East Indian cereal.

millstone-grit (mil'ston-grit), n. A silicious conglomerate rock, so called because it has been worked for millstones in England. It constitutes one of the members of the Carboniferous group, underlying the true coal-measures, and overlying the mountain limestone. In Wales and southwestern England it is known as "farewell rock," because when the miners strike it they bid farewell to profitable scams. The millstone-grit is an important and persistent member of the Carboniferous series both in Europe and in the United States. In parts of England it attains a thickness of over 5,000 feet. Where the series to which this name is given is developed to this extent, however, it contains intercalated beds of shale and clay and even of coal. In Pennsylvania the millistone-grit is sometimes called the Great or Pottwille Conglomerate. At Pottsville, on the eastern edge of the anthracite fields, it is over a thousand feet thick, but it thins very much in going west.

Mimosa (mi-mo'sä), n. [NL. (Tournefort, 1700), so called from its imitating the sensibility of animal life; < L. mimus, < Gr. μίμος, a mimic: see mime, n.] 1. A large genus of leguminous plants of the suborder Mimoseæ and the tribe Eumimoseæ, characterized by a legume with entire or jointed valves which break away from tire or jointed valves which break away from a narrow persistent placenta. The plants are either herbs, erect or climbing shrubs, or sometimes trees, and are often prickly. The leaves are almost always bipinnate, but rarely there are none, or the expanded petiolo (phyllodium) takes the place of the leaf; and in many species the leaves are sensitive, closing when touched. The flowers are small and seasile, usually having the stamens very much longer than the corolla; they are arranged in globular heads or in cylindrical spikes. About 250 species have been described, natives of the warmer parts of America and Africa, of tropical Asia, and of the Mascarene Islands. Many are cultivated, the most common being the sensitive-plant or humble-plant of hothouses, M. pudica, which is a branching annual, one or two feet in height, having a great many small leafets, all highly sensitive when touched. M. myriadenia is a woody climber of tropical America, and is remarkable for the great height which it attains, ascending to the tops of the tallest trees.

[ $\langle Gr. \mu i \mu o c \rangle$ , a mimic,  $+ \tau i \pi o c$ , form.] In zool, and zoogeog., a type or form of animal life which in one country is the analogue or representative of a type or form found in another country, to which it is not very closely related. Thus the American stations (Leterical Country) closely related. Thus, the American starlings (Interido) are mimotypes of the Old World starlings (Sturnidæ); the American genus Geomys is mimotypic of the African Georychus; the American jumping-mouse (Zapus) replaces the Jerboas (Dipus) of Africa.

Minotypes, forms distantly resembling each other, but fulfilling similar functions. . . . By the use of this term, the word "analogue" may be relieved of a part of the burden borne by it. Smithsonian Report (1881), p. 460, note.

Mimuleæ (mi-mū'lō-ō), n. pl. [NL. (Bentham and Hooker, 1876), < Mimulus + -ee.] A subtribe of plants of the order Scrophularineæ and the tribe Gratioleæ, characterized by a five-toothed calyx, by having the stamens inserted within the corolla-tube, with the anther-cells contiguous, and by a loculicidal capsule with two or four valves. The subtribe embraces 6 genera, Mimulus being the type, and about 56 species.

mimine (mim'in), a. Of or pertaining to the Mimulus (mim'ū-lus), n. [NL. (Linnæus, 1753), so called from the resemblance of its corolla to a mimist; (mī'mist), n. [< mimc + -ist.]

A mask; < LL. mimulus, a little mime, dim. of L. mimulus, a little mimulus, a little mime, a little mime, a litt mus: see mime.] A genus of scrophulariac cous plants of the tribe Gratiolea, type of the subtribe Mimulea, characterized by a tubular calyx, which is almost always five-angled or five-toothed, by a two-valved capsule, and by having numerous seeds, with the placentæ usually united to form seeds, with the placentæ usually united to form a central column. They are reclining or erect, rarely tall, and alightly woody herbs, with opposite undivided leaves, and often showy flowers, which are yellow, orange, red, violet, or rose-colored, and solitary in the axis of the leaves, or sometimes racemed at the tips of the branches. The species, numbering 45 or 50, are especially numerous in Pacific North America, but are also widely dispersed elsewhere in temperate regions, though not in Europe. Plants of the genus bear the general name of monkey-flower. Mingens and M. alatus, with violet purple flowers, are common species of wet places in the eastern United States. Various species are cultivated; chiefly in conservatories, some much prized. Among them are M. mochatus, the musk-plant of gardens, strongly musk-scented, the flowers small and pale-yellow; M. cardinalis, with large scalic corolla; and M. glutinosus, a shrubby, very ornsmental conservatory species, the flowers from salmon-colored to scarlet.

Mimus (mi'mus), n. [NL., < L. mimus, < Gr. μίμος, an imitator: see mime.] A genus of American birds of which the mocking-bird, M. polyglottus, is the type. See mocking-bird, and out under cathing cut under catbird.

Mimusops (mi-mū'sops), n. [NL. (Linnæus, 1753), so called from the fancied resemblances of the flowers to an ape's face; ⟨Gr. μιμοίς, gen. 1753), so called from the fancied resemblances of the flowers to an ape's face; ⟨Gr. μμοίς, gen. of μμό, an ape (⟨μμείσθα, imitate, μίμος, an imitator: see mime), + ἀψ, face.] A genus of dicotyledonous gamopetalous plants of the natural order Sapotaceæ and the tribe Bumelieæ. It is characterized by having the six or eight segments of the calyx arranged in two series, the outer ones including the inner, which are more slender; the lobes of the corolla entire and three times as many as the calyx-segments; and the six or eight staminodis, which are alternate with the same number of stamens. They are trees, or rarely shrubs, with a milky juice, and usually small white flowers, which are often fragrant, in axillary clusters. About 30 species are known, found throughout the tropica. Several, from India and Ceylon, yield a heavy durable timber, and M. Elengi also produces small edible berries, the seeds of which afford an abundance of oil. See balatagum, bully-tree, cour-tree, and didly3.

[L., also mna, ⟨ Gr. μνα, a weight, a sum of money; ⟨ Heb. māneh, a weight, prop. part. portion, number, ⟨ mānāh, divide, measure out, allot.] A unit of weight and of value, originally Assyrian, but used also by the Granks and other propiles. and of Vaine, originally Assyrian, but used also by the Greeks and other ancient peoples. Bronze and stone Babylonian and Assyrian standards show that there were two Assyrian minas, one varying from 960 to 1,040 grams, and the other of half that weight. The Assyrians divided the mina into 60 shekels, and 60 minas made a talent. In Athens at the time of Pericles it was, in weight of silver, 100 drachmas, equivalent to 480.3 grams, or 16.4 ounces avoirdupois, or 14 + ounces troy, and was in value about \$18.

That which feels, wills, and thinks; the conscious subject; the ego; the soul. Some writers make an obscure distinction between mind, soul, and spirit. With them the mind is the direct subject of consciousness.

For to say truely, what els is man but his minde? which, whoseeuer haue skil to compasse, and make yeelding and flexible, what may not he command the body to perfourme?

Puttenham, Arte of Eng. Poesle, p. 164.

Mind, therefore, is to be understood as the subject of the various internal phenomena of which we are conscious, or that subject of which consciousness is the general phenomenon. Consciousness is, in fact, to the mind what extension is to matter or body. Though both are phenomena, yet both are essential qualities; for we can neither conceive mind without consciousness, nor body without extension.

Descartes, Meditations (tr. by Veitch), iv.

In psychology, on the other hand, the individual mind may mean either (i.) the series of feelings, or "mental

phenomena" above referred to; or (ii.) the subject of these feelings, for whom they are phenomena; or (iii.) the subject of these feelings or phenomena + the series of feelings or phenomena themselves, the two being in that relation to each other in which alone the one is subject and the other a series of feelings, phenomena, or objects.

Unconscious mind. See unconscious = Syn. Mind, Intellect, Soul, Spirit, reason, sense, brains. Primarily, mind is opposed to matter, intellect to feeling and will, soul to body, and spirit to flesh. The old division of the powers of the mind was into intellect, sensibilities, and will; mind is variously used to cover all or some of these, but when less than the whole is meant it is chiefly the intellect: as, he seems to have very little mind. Yet mind is sometimes used with principal reference to the will: as, I have half a mind to go. Where spirit and soul differ, spirit applies rather to moral force, and soul to depth and largeness of feeling. (See soul.) In the New Testament soul is used to translate a word covering all life, whether physical or spiritual, as in Mat. x. 28. Upon the highest usage in the Scriptures is founded the common representation of man as immortal by the word soul. Hence soul is used for the central, essential, or life-giving part of anything: as, he was the soul of the party. The definitions under each of these words should be studied to get its range and idlomatic uses. See reason.

2. Of me; belonging to me. The independent possessive form of the first personal me, corresponding to my as attributive before the thing possessed: as, that (the thing spoken of or indicated) is mine (is of me, belongs to me, or is my thing); these books are all mine (my property): in this use now virtually an elliptical use of mine in def. 3.

My doctrine is not mine [of me], but his [of him] that sent me.

John vii. 16.

3. Belonging to me: merely possessive, and construed as an adjective, preceding its noun, which may, however, be omitted. When the noun is expressed, the form is in ordinary use now reduced to my, the older form mine being rarely used except archaically before a vowel or h, or by a familiar transposition after the noun, as in sister mine, baby mine, etc.

minare, open a mine<sup>2</sup>, n. mine, lead from place to place: see mine<sup>2</sup>, v.]

1. An excavation in the earth made for the mine, lead from place to place: see mine<sup>2</sup>, v.]

1. An excavation in the earth made for the purpose of getting metals, ores, or coal. Minework, in metal mines, consists in sinking shafts and winzes, running levels, and stoping out the contents of the vein thus made ready for removal. In coal-mining the operations differ in detail from those carried on in connection with metal mines, but are the same in principle. The details vary in coal mining with the position and thickness of the beds. A mine differs from a quarry in that the latter is usually open to the day; but in any mine a part of the excavations may be an openwork (see that word), as in running an adit-level, which may be carried to a considerable distance before becoming covered by earth or rock. When the term mine is used, it is generally understood that the excavation so named is in actual course of exploitation; otherwise some qualifying term like abandoned is required. No occurrence of ore is designated as a mine unless something has been done to develop it by actual mining operations. There are certain excavations which are called neither mines nor quarries as, for instance, places where clay is being dug out for bricks; such places are frequently (especially in England) called pits, and also openworks. With few and not easily specified exceptions, a quarry is a place where building stone, or building materials of any kind (as lime, cement, etc.), are being got; a mine, where some metal or metalliferous ore is in the process of exploitation. In English the term mine includes excavations designated by them mine res; quarry is the equivalent of the French carrière. The term mine is sometimes extended in use to include the ores as well as the excavation.

Any constituent of the earth's crust; more specifically, an inorganic body occurring in nature, homogeneous and having a definite chemical com-position which can be expressed by a chemi-

geneous and having a definite chemical composition which can be expressed by a chemical formula, and further having certain distinguishing physical characters. A mineral is in almost every case a solid body, and, if it has been formed under suitable conditions, it has, besides its definite chemical composition, a definite molecular structure, which is exhibited externally in its crystalline form and also internally in its cleavage, its belavior with respect to light (optical properties) heat-propagation, electricity, etc. Furthermore, it has other characters, which may belong to it even when amorphous (though sometimes modified by crystallization), as specific gravity, hardness, fracture, tenacity, luster, color, fusibility, etc. A certain variation in physical characters is consistent with the identity of a mineral species, but if the same substance, as calcium carbonate in calcite and in aragonite, occurs in two or more groups of crystals which cannot be referred to the same fundamental form, each is ranked as a distinct species. A difference in specific gravity and in some other physical characters usually accompanies the difference in crystallization. How great a variation in chemical composition, as by isomorphous replacement, is consistent with the identity of a single mineral species is a point about which opinion differs: some authors treat the garnets (all of which have the same form and the same general formula) as a group of related species, and others as varieties of a single species. Chemical compounds formed in the laboratory or in the arts are not regarded as minerals; but where such compounds as are already known as occurring in nature are thus formed they are usually called artificial minerals. Minch attention has been devoted of recent years to the artificial reproduction of minerals, but almost solely as a matter of scientific interest, and as throwing light on the processes of nature.

The conversion of vesselable phuret, or other ore. The conversion of vegetable matter into coal is not properly mineralization, although sometimes so called. Proper mineralization of vegetable matter does take place, however, as when wood is converted into opal, or becomes silicified, as very frequently happens under certain conditions. This is commonly and properly called fossilization or petrifaction, and more rarely mineralization.

Also spelled mineralization.

Some phenomena seem to imply that the mineralization must proceed with considerable rapidity, for stems of a soft and succulent character, and of a most perishable nature, are preserved in flint.

mineralizer (min'e-ral-i-zèr), n. A substance or agent that mineralizes; a substance that combines with a metal to form an ore. The principal mineralizer is sulphur, and combinations of the metals with this substance form the most common ores, especially at some depth below the surface. Near the surface the sulphureted ores are usually found to have been changed to oxids and carbonates. Some metals (as tin) are almost exclusively mineralized by oxygen; others (as iron) are extensively mineralized by both oxygen and sulphur. Arsenic, antimony, and chlorin are other important imineralizers. Some metals (as silver) exist in combinations containing sulphur, arsenic, and antimony, all combined with the metal to form one mineral species. Also spelled mineralizer.

Coleridge, Love 3. In politics: (a) One of the persons appointed by the sovereign or chief magistrate of a counby the sovereign or chief magistrate of a country as the responsible heads of the different departments of the government; a minister of state: as, the minister of foreign affairs, of the interior, of finance, of war, of justice, etc. These officers constitute the ministry or executive department of the government; at their head is the prime (first) minister, or premier, the immediate deputy or representative of the sovereign or chief magistrate; he and other ministers, selected by him, are called collectively, as his coordinate advisers in matters of policy, the cabinet. Minister is used in most European countries as the official title of all heads of departments, but in Great Britain only in a generic sense (as, a minister of the crown), the individual ministers being officially designated the secretary of state for foreign affairs, for war, for the colonies, etc., or by other titles, as chancellor of the exchaquer (minister of finance). In the government of the United States the title minister is not used at all, and there is no ministry; the corresponding officers, differing from the preceding both in mode of appointment and degree of power and responsibility, are called secretaries (of state, of the interior, of the treasury, of war, of the navy, of agriculture), postmaster-general, and attorney-general. See cabinet, 4.

Very different training was necessary to form a great minister for foreign affair.

Very different training was necessary to form a great minister for foreign affairs. Macaulay, Hist. Eng., xi. (b) A diplomatic representative of a country abroad; a person accredited by the executive authority of one country to that of another as its agent for communication and the transaction of business between the two governments; specifically, the political representative of a state in another state, in contradistinction to an ambassador, who holds a nominally higher rank as in general the personal representative of the sovereign or chief of the state at the court of another sovereign. The United States heretofore have sent and received only ministers in this specific sense, called in full either envoys extraordinary and ministers plenipotentiary or ministers resident.

We (the United States) have no ambassadors, we have comparatively few enous extraordinary and ministers pelenipotentiary, but seem to prefer ministers resident.

E. Schuyler, Amer. Diplomacy, p. 112.

4. Eccles., in the New Testament, a servant of God, God's word, Christ, or the church; an officer of the church; an attendant or assistant (Acts xiii. 5): translating διάκοιος (whence deacon), but sometimes λειτουργός (liturge) or ὑπηρέτης (an assistant); hence, any member of the ministry. The word is used of civil authorities in Rom. xiii. 4-6. In the ancient church minister usually meaut a deacon or one in minor orders, the Latin word minister being the equivalent of the Greek διάκονο. See ministry.

is valuable, and the animal is systematically trapped, especially in British America. Like its relatives, the mink exhales a strong musky odor, and is destructive to poultry. It has been tamed, and bred in minkeries, like the ferret. The little black or mountain mink, described by Audubon and Bachman as a distinct species, P. nigrescens, is a small dark variety. The corresponding animal in Europe is P. lutreola, commonly called norz or nörz, and by its swedish name maink (sometimes mank)—the designation European mink being a late book-name. It is much like the American mink, but its average size is smaller, and it usually has the upper lip as well as the chin white, and presents ecrtain dental peculiarities. The Siberian mink, lately so called, is the kulon, P. sibiricus, a quite different species. Also called vison.

2. In the United States, one of many different fishes of small size. (a) Any cyprinoid of the genus Phozinus, of which there are several species, from 13 to 3 inches long, in the Mississippi basin and westward, as P. neogens, P. fammeus, P. phlegethonis. This is the correct use of minnow, though in popular speech it extends to various other little cyprinoids, also loosely called roach, dace, shiner, etc. Among these may be mentioned the red minnows of the genus Chrosomus, as C. erythrogaster, one of the pretiest of all, 2 or 3 inches long; the silvery minnow, Hybognathus nuchalis, and others of this genus; the black-headed minnow or fishead, Pimephales promelas; the blunt-nosed minnow, Hyborhynchus notatus; the Ivaan hardmouth minnow, Cochlognathus ornatus; the texan hardmouth minnow, Cochlognathus ornatus; the bull-headed and straw-colored minnows, Citida taurocephalus and C. stramines; the spotted-tail, C. sigmaturus, and more than 60 other kinds of Citids; about 50 shiners of the genus Minnilus; various species of the genera Rhinichthys, Ceratichthys, Apocope, Couesius, etc. These abound in fresh waters of the United States, and minnow is the usual name of all those which have not more particular designations. (b) One of numerous small cyprinodont fishes, otherwise known as killifishes and mummychops, and more fully called top-minnous, as Zygonectes notatus and many others of this genus. The most abundant of these is Fundutus heterocitus, found in brackish waters from Maine to Mexico, and sometimes specified as salt-vater minnow. F. diaphanus is the spring minnow. (c) Any American member of the family Umbridæ and genus Umbra or Melanura, as U. or M. limi, more fully called mud-minnous, 4 inches long, found from New England to Minnesota and South Carolina, often in mere mud-holes which would hardly be expected to lodge any fish. It is closely related to U. crameri of Austria. II. n. 1. A person of either sex who is under age; one who is of less than the legal age for the performance of certain acts; one under the authority of parents or guardians, because of not having reached the age at which the law permits having reached the age at which the law permits one to make contracts and manage one's own property; an infant in the legal sense. In Scots law, minor, when used in contradistinction to pupil, signifies a person above the age of pupilarity (twelve in females and fourteen in males) and under that of majority, which in both sexes is twenty-one years. The technical term in English and United States law for one under the age of legal capacity (twenty-one years) is infant, but minor is used in the same sense in general literature. Compare age, n., 3.

 \( \text{L. minister, a servant, attendant: see minister. } \) Cf. ML. ministerialis in same sense, \( \) ministerialis in same sense, \( \) ministerium, service: see ministerial. \( \) 1. A musician, especially one who sings or recites to the accomespecially one who sings or recites to the accompaniment of instruments. Specifically, in the middle ages, the minstrels were a class who devoted themselves to the amusement of the great in castle or camp by singing ballads or songs of love and war, sometimes of their own composition, with accompaniment on the harp, lute, or other instrument, together with suitable mimicry and action, and also by storytelling, etc. The intermediate class of professional musicians from which the later minstrels sprang appeared in France as early as the eighth century, and was by the Norman conquest introduced into England, where it was assimilated with the Anglo-Saxon gleemen. Everywhere the social importance of the minstrels slowly degenerated, until in the fifteenth century they had formed themselves generally into glids of itinerant popular musicians and mountebanks. In England they fell so low in esteem that in 1697 they were classed by a statute with rogues, vagabonds, and sturdy beggars; but in France their glids were maintained until the revolution. See gleeman, troubadour, trouvère, and jongleur.

Wake ye from your sleep of death,

Minstrels and bards of other days!

Scott, Bard's Incantation

But while the mineral proper accompanied his lord to the field and shared with him the danger and the honour of his warlike exploits, the connection between him and the humbler kind of entertainer [the jongleur], who was still the servant of the multitude rather than of a particular lord, cannot have been wholly forgotten.

A. W. Ward, Eng. Dram. Lit., 1. 13.

Hence —2. Any poet or musician. [Poetical.]—3. Originally, one of a class of singers of negro melodies and delineators of life on the Southern plantations which originated in the United States about 1830: called negro minstrels, although they are usually white men whose faces and hands are blackened with burnt Cork. The characteristic feature of such a troupe or band is the middle-man or interlocutor, who leads the talk and gives the cues, and the two end-men, who usually perform on the tambourine and the bones, and between whom the indispensable conundrums and jokes are ex-

changed. As now constituted, a negro-minstrel troupe retains but little of its original character except the black faces and the old jokes.

A slow and graceful dance, invented, probably in Poitou, France, about the middle of the seventeenth century. Throughout the eighteenth century it was the most popular of the more stately and ceremonious dances. — 2. Music for such a dance, or in its rhythm, which Music for such a dance, or in its rhythm, which is triple and slow. Minuets are frequently found in the old suite, and also in the later sonata and symphony. They properly consist of two contrasted sections of sixteen measures each, the second of which is generally called a trio, because originally written for but three instruments; but this regular form is often considerably modified. Beethoven was the first to replace the minuet in the sonata and the symphony by the scherzo, which resembled the minuet somewhat in rhythm, but was more sprightly and unrestricted in form and spirit.

Bacon, Advancement of Learning, ii. 152.

To speak properly, there is not one miracle greater than another, they being the extraordinary effects of the hand of God, to which all things are of an equal facility.

Sir T. Browne, Religio Medici, I. 17.

A miracle may be accurately defined a transgression of a law of Nature by a particular volition of the Deity, or by the interposition of some invisible agent. Hume, Human Understanding, Of Miracles, x., note.

What are miracles? They are the acts and manifestations of a Spiritual Power in the universe, superior to the powers and laws of matter. Channing, Perfect Life, p. 248.

The definition of a miracle as a violation of the laws of nature is, in reality, an employment of language which, in the face of the matter, cannot be justified.

Huzley, Hume, p. 129.

able antecedent. The mirage of the desert presents an appearance of objects reflected in a surface of water; in this case the heated earth rarefles the air in the lower strata faster than it can escape, and the flatness of the ground conduces to the maintenance of the resulting abnormal distribution of density. Displacement by mirage is commonly vertical, but is lateral when the density-gradi-

ent is more or less inclined to the vertical. Looming and fata Morgana are species of mirage. See these words. Hence—2. Deceptiveness of appearance; a delusive seeming; an illusion.

A polished surface, as of metal, or of glass backed by a metal or other opaque substance, used to reflect objects, especially to reflect the face or person as an aid in making the toilet. The mirrors of the ancients were of polished metal, as are those of the Japanese and some other Oriental nations. Glass mirrors, consisting of transparent glass with a backing of metal to act as the reflecting surface, did not become common until the sixteenth century. Mirrors have been used for decoration of the person, being sewed to the material of the dress and serving as larger and more brilliant spangles; they have also been used in the interior decoration of buildings, especially in Persia and the East Indies. (Compare article.) The common method of preparing glass mirrors is to cost one side of the glass with an amalgam of tin and mercury (called silvering); but mirrors are now often made by depositing pure silver on the glass.

2. Specifically, in optics, a surface of glass or polished substance that forms images by the reflection of rays of light; a speculum. Optical mirrors are plane, convex, or concave. A plane mirror gives a virtual image whose apparent position is on the opposite side of the mirror from the reflected body and at an equal distance from it. A concave spherical mirror (supposing that it includes only a small part of a large spherical surface) reflects rays parallel to its axis, as those from the sun, to a point

verted and diminished image formed at f. If, however, the iuminous body be at f, the image is formed at f. If, however, the iuminous body be at f, the image is formed at L, also real and inverted, but magnified. If the iuminous body is at F, the principal focus, the reflected rays are sent out in parallel lines; if nearer the mirror than F, the rays after reflection are divergent, and the image is virtual, erect, and magnified. In a concave parabolic mirror parallel rays are brought exactly to a focus at the geometrical focus; hence this form is suitable for reflectors, as in the headlight of a locomotive. The images formed by convex mirrors are always virtual and smaller than the object.

(a) A mirror in which, in various systems of fortune-telling or divination, a person was supposed to see reflected scenes in his future life, or an answer to some question. (b) A Japanese mirror of cast-metal, which, when made to reflect the sun's rays upon a screen at a proper distance, shows in the reflection bright images which are counterparts of raised figures or characters on the back of the mirror. These, like all Japanese mirrors, are generally circular in form, are about one eighth of an inch thick in the thinnest part, and are usually surrounded on the back by a raised rim. The surface of the mirror is generally slightly convex, and coated with an amalgam of mercury and the metal forming the mirror. The surface is locally modified in its curvature by the characters, either by the shrinkage of the metal in cooling, or by its deformation in the process of smalgamation or of polishing. Only a few of the mirrors which apparently answer to the general description in respect to their construction possess the "magic" property in any great degree.—Soemmering's mirror, in microscopy, a plane mirror of polished steel, smaller than the pupil of the eye, placed before the eyeplece of the microscope to be used like the camera lucida in making drawings.

Chaucer, Prol. to C. T., 1. 767.

He's all my exercise, my misth, my matter.

Shak., W. T., i. 2. 166. =Svn Mirth Cheerfulnem

I have always preferred *cheerfulness* to *mirth*. The latter I consider as an act, the former as a habit, of the mind.

Misth is short and transient; cheerfulness, fixed and permanent. Those are often raised into the greatest transports of misth who are subject to the greatest depressions of melancholy; on the contrary, cheerfulness (though it does not give the mind such an exquisite gladness) prevents us from falling into any depths of sorrow. Misth is like a flash of lightning, that breaks through a gloom of clouds, and glitters for a moment; cheerfulness keeps up a kind of daylight in the mind, and fills it with a steady and perpetual serenity.

Addison, Spectator, No. 881.

= Syn. 2. Mischance, Mishap, Misfortune, Disaster, Calamity, Catastrophe, misadventure, ill, harm, reverse, blow, stroke, trouble. The first six words are arranged in the order of strength; they agree in denoting untoward eventa, produced by causes presumably independent of the sufferer. Mischance is the lightest word for that which is really disagreeable; a mishap may be comparatively a trivial thing; both generally apply to the experience of individuals. Misfortune is the most general of these words; a misfortune is a really serious matter; it may befall a person, family, or nation. A very serious misfortune affecting large numbers is a calamity, the central idea of which is wide-spread and general mischief. A disaster is not necesarily wide-spread; it is generally sudden, and its importance is in its effects upon other interests, as marring or ruining particular plans, hopes, courses, or conditions of things. A disaster may befall an individual; a calamity can come to an individual only by affecting his welfare largely, or bringing him into deep distress. A calastrophe is strictly a great misfortune bringing things to an end, a final crash, a finishing stroke: as, this brought on the calastrophe. See affliction.

Mishmah (mish'në), n. [Also Mishna; Heb. mishnāh, repetition, explanation, < shānāh, repeat.] 1. In Jewish lit., a collection of halachoth or binding precepts and legal decisions deduced by the ancient rabbis from the Pentateuch and itself forming a condensate literature. deduced by the ancient rabbis from the Pentateuch, and itself forming a second or oral law. See halachah. These halachoth, which had been preserved for several centuries by tradition among the doctors of the synagogue, were gradually committed to writing. The first who attempted to reduce them to order was Hillel I. (B. C. 75-A. D. 10), president of the Sanhedrim, who arranged them in six Sedarim or orders. The final redaction, however, was made by Rabbi Jehudah, surnamed "the holy," about the end of the second century of our era. The Mishnah is divided into six parts, each of which contains a number of treatises, which are subdivided into chapters, and these again into paragraphs or mishnoth. The first part relates to agriculture; the second regulates the manuer of observing festivals; the third treats of women and matrimonial cases; the fourth of damages and losses in trade, etc.; the fifth is on "holy things"—that is, oblations, sacrifices, etc.; and the sixth treats of the several sorts of purification. The Mishnah forms the text on which the Gemara is based. See Gemara and Tainud.

which the Gemara is based. See Gemara and Taunua.

The Mishnah consists chiefly of Halakhah; there is, comparatively speaking, little Agadah to be found in it. It is not, however, as many think, either a commentary on the Halakhic portions of the Pentateuch, or on the ordinances of the Sopherim, or on both together. It rather presupposes the knowledge of and respect for both the Mosaic and the Sopheric laws, and it only discusses, and finally decides on, the best mode and manner of executing these.

Cf. also def. 3. See mistress, Mrs.] 1. Mistress: a reduced form of this title, which, so reduced, came to be regarded, when prefixed to the name of a young woman or girl, as a sort of diminutive, and was especially applied to young girls (corresponding to master as applied to young byes), older unmarried girls or women being styled mistress even in the lifetime of the mother; later, and in present use, a title prefixed to the name of any unmarried women or girl. In a restricted use, the title Miss, with the surname only, now distinguishes the eldest daughter of a family, the younger daughters having the title Miss prefixed to their full name: as, Miss Brown, Miss Mary Brown, etc. Some matronly unmarried women, holding independent positions as householders or otherwise, are still styled Mistress (Mrs.) as a mark of special respect, at least in some parts of the United States. In speaking or writing of two or more persons of the same name by the title of Miss, the plural form is often given to the name as a whole, as the Miss Smiths.

nally the ordinary, canon, and some other parts of the mass were contained in the sacramentary, which also included the offices for the other sacraments. In addition to this the antiphonary, lectionary, and evangeliary had to be used. Early in the eighth century the name of missal (missalis (ac. liber), missale) came to be applied to the sacramentary, and later to books containing additional parts of the mass. A book like the modern missal, containing all the forms of the mass, was called a plenary missal (missale plenarium). The modern Roman missal (the "reformed missal") was issued substantially in its present form under Plus V. in 1570, and revised again under Clement VIII. and Urban VIII. It is the only Latin missal allowed to be used in the Roman Catholic Church, with the exception of the limited local use of the Ambrosian, Mozarabic, and some monastic rites. Roman Catholic priests in England do not follow the Sarum and other ancient English uses, but the present Roman rites. The Unlats and other Latinizing communities in Oriental countries are allowed to retain their ancient offices, with alterations more or less considerable. In the Roman missal, after the introductory matter (calendar, general rubrics, etc.) come the introits, collects, epistles, gospels, graduals, offertoria, secreta, communions, postcommunions, etc., throughout the year. The ordinary and canon of the mass are placed in the middle of the book, between the proper of Holy Saturday and that of Easter Sunday. After these masses de tempore follow the common of saints, votive and special masses, etc., and masses allowed to be used in special places. The euchologion of the Greek Church answers not to the missal, but to the original sacramentary.

The Sacramentary became subdivided into the full mass-book or missal properly so named.

winter with small white berries containing a glutinous substance. The shrub is said to be disseminated by birds, which eat the berries and disperse the undigested seeds in their droppings. It is found on a great variety of trees, especially the apple-tree, but seldom on the oak. The mistletoe (compare def. 2) was consecrated to religious purposes by the ancient Celtic nations of Europe, and was held in peculiar veneration by the Druids, especially when found growing on the oak. Traces of this old superstitious regard for the mistletoe still survive in European countries, as in the custom of kissing under it at Christmas. It was formerly highly esteemed as an antispasmodic, but is not now so used. It seems, however, to have some pharmaco-dynamic properties.

The mistral state of that region is the state of the blows in furious gusts from time to time in much of that region, notably in winter. The mistral derives its peculiar properties from the character of the country over which it blows; it extends from the mouth of the Ebro to the Gulf of Genoa, but is strongest and most frequent over Provence, and especially in the delta of the Rhone. Also written maestral.

When the Mistral blows, the sky is almost always blue and cloudless, and the air very dry; the contrast between the prevailing sunshine and the piercing cold of the wind is very striking. In the Rhone valley every second day is a Mistral day; in Marseilles it blows 175 days in the year.

Mitesonce formed a comprehensive genus Acarus or family Acaridæ, terms not yet obsolet; but, with the introduction of many more genera, the establishment of several families, and the elevation of the group to the rank of an order, a more elaborate nomenclature has been established, in which neither Acarus nor Acaridæ is retained. (See Acarida.) Adult mites are eight-legged like most archindans; but some six-legged immature forms at one time constituted a supposed genus Leptus. (See Leptus, and cut under harvest-tick.) The species of mites are very numerous, diversified in form, and various in habita. Many are parasitic; others are terrestrial or aquatic; others live in cheese, flour, sugar, etc. Mite is consequently much used in composition. The cheese-mite or flour-mite is Tyroglyphus siro or T. longior; the sugar-mite is Glyciphaga prunorum, or another of the same genus. Such mites compose the family Tyroglyphidæ, and are among those longer known as species of Acarus or Acaridæ. Itch-mites are Sarcoptiaæ, as Sarcoptes scabie. (See cut under itch-mite.) Mangemites are Demodicidæ; garden-mites or harvest-mites, Trombidiidæ; spinning-mites, Tetranychidæ; beetle-mites or wood-mites, Orbotadæ, spinning-mites, Tetranychidæ; peetle-mites, Phytoptidæ. Certain mites, the Ixadidæ, are commonly distinguished as ticks, as Ixadies ricinus (see cut under Acarida), and those of the family Trombidiidæ are indifferently called harvest-mites, harvest-ticks, harvest-ticks, parest-ticys, red-bugs, and by other names. See the compound and technical names.

In organ-building, a fluestop having two or more pipes to each digital, the pipes being so tuned as to give certain sets of the shriller harmonics of the fundamental of the shriller harmonics of the fundamental tone of the digital; a compound stop. The stop is known as "of two ranks," "of three ranks," etc., according to the number of pipes to a digital. The harmonics chosen for reinforcement vary with the pitch of the fundamental tone, a low tone being provided with higher harmonics than a high one. The points in the compass where changes from one set of harmonics to another take place are called breaks. The harmonics usually chosen are those that lie at the intervals of fifths or octaves from the fundamental tone, rarely at those of thirds or sevenths. Mixtures serve two purposes: to enrich the total effect of heavy combinations by reinforcing the brilliant overtones of the harmony, and to emphasize the upper tones of heavy chords by reinforcing their nearer harmonics. They are enver properly used except in combination with foundation-stops. Mixtures are variously named, as cornet, furniture, etc.

Mixture, Mixellany, Medley, Farrago, Hotchpotch, Jumble; variety, diversity. Mixture is a general term denoting a compound of two or more ingredients, more often, but not necessarily, congruous. Miscellany is a collection of things not closely connected, but brought together by rational design: "A miscellany has the diversity without the incongruity of a medley." (C. J. Smith, Syn. Disc., p. 564.) Specifically, a miscellany has the diversity without the incongruity of a medley." (C. J. Smeth, Syn. Disc., p. 564.) Specifically, a miscellany is a collection of independent literary pieces, the unity lying only in their general character. A medley is a mixture or collection of things distinctly incongruous the word has the specific sense of a song or tune made up of scraps of other songs or tunes ingeniously and amusingly fitted together. Farrago emphasizes the confusion of indiscriminateness of the mixture or collection: it is applied chiefly to printed or spoken discourse. Hotchpotch is a still more energetic expression of the confusion of the collection, the idea being drawn from the boiling together of shreds of all sorts of food. Jumble implies the idea of a heap turned over and over till everything is hopeleasly mixed. The figurative uses correspond essentially to the literal.

Lastly, under the head of Modality, we have seen that all phenomena, as objects, are in themselves contingent, or only hypothetically necessary, i. e. necessary on the presupposition of the existence of something else.

E. Caird, Philos. of Kant, p. 564.

Just as the adjectives which contain the modal force of possibility can lose this modality, so also certain adjectives can assume the same, although the modality was not originally in them.

3. In gram., the designation, by the form of the verb, of the manner of our conception of the verb, of the manner of our conception of an event or fact, whether as certain, contin-gent, possible, desirable, or the like. The modes of the English verb are the indicative, subjunctive, and im-perative; and other verbal phrases are usually called by the name of modes, as potential, conditional, and so on. See these terms. Also commonly, but less properly, mod. 4. The natural disposition or the manner of existence or action of anything; a form: as,

heat is a mode of motion; reflection is a mode of consciousness.

There is something in things which neither is the thing itself, nor another thing, nor yet nothing, but a certain medium betwixt them both. And this used to be called a mode: for example, A degree of quality is not quality, nor yet is it wholly nothing, but a mode.

Burgersdious, tr. by a Gentleman.

A mode is the manner of existence of a thing. Take, for example, a piece of wax. The wax may be round or square or of any other definite figure; it may also be solid or fluid. Its existence in any of these modes is not essential; it may change from one to another without any substantial alteration. As the mode cannot exist without a substance, we can accord to it only a secondary or precarious existence in relation to the substance, to which we accord the privilege of existing by itself, per se existere; but though the substance be not astricted to any particular mode of existence, we must not suppose that it can exist, or at least be conceived by us to exist, in none. All modes are therefore variable state; and though some mode is necessary for the existence of a thing, any individual mode is accidental. Sir W. Hamilton, Metaph., viii. ode is the manner of existence of a thing. Take,

I am . . . assured that those *modes* of consciousness which I call perceptions and imaginations, in as far only as they are *modes* of consciousness, exist in me.

5. A combination of ideas. See the quota-

Modes I call such complex ideas, which, however compounded, contain not in them the supposition of subsisting by themselves, but are considered as dependencies on or affections of substances.

Locke, Human Understanding, II. xii. 14.

There are some [modes] which are only variations of different combinations of the same simple idea, . . . as a dozen, or score: which are nothing but the ideas of so many distinct units added together: and these I call simple modes, as being contained within the bounds of one simple idea.

Locke, Human Understanding, II. xii. 5.

Combinations of simple ideas of different kinds I have called "mixed modes." 'mixed modes."

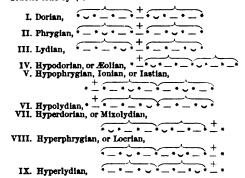

Locke, Human Understanding, II. xii. 5.

6. In logic: (a) A modification or determination of a proposition with reference to possibility and necessity. (b) A variety of syllogism. See mood<sup>2</sup>, the more usual but less proper form.

(c) The consignificate of a part of speech. (d)An accidental determination.—7. In music:
(a) A species or form of scale; a method of dividing the interval of the octave for melodic purposes; an arrangement of tones within an octave at certain fixed intervals from each ofher. Three great systems of modes are to be distinguished—the ancient Greek, the Gregorian, medieval, or ecclesiastical, and the modern. These three were successively derived from each other, but with noteworthy changes of both principle and nomenclature. (1) In the Greek system each mode consisted of two tetrachords (two whole steps and one half-step in each) plus one whole step (the diazcuctic tone). The nature and the name of the mode varied according to the tetrachord used as a basis and ascording to the position of the diazcuctic tone, or, in other words, according to the relative order of the whole steps and half-steps. When the diazcuctic tone lay between the two component tetrachords, the mode was named slimply from the tetrachord used—the mode containing Dorian tetrachords was called Dorian or Doric, etc.; but when it lay below or above both of them, the prefuse hypo- and hyper-respectively were added, as Hypophrygian, Hyperhydian, etc. Below is a table of the nine original modes, reckoned upward, the whole steps being indicated by—, the half-steps by—, the constituent tetrachords by—, and the diazcuctic tone by +: purposes; an arrangement of tones within an

These modes were embodied in scales of about two octaves, sometimes called transposing scales, which were more or less susceptible of transposition. By the later theorists fifteen such scales were recognized, each derived from one of the foregoing modes, and beginning at a different pitch, each a half-step higher than the preceding. These scales, though not always differing from each other in mode, but only in relative pitch, were also called modes, and were named like the modes themselves. Assuming the lowest

tone of the lowest scale to be A, the series of later scales or "modes" would be:

Hypersolian, or lower Hyperlydian (mode IX.), Br. Hypersolian, or lower Hyperlydian (mode IX.), Br. Hyperlydian (mode IX.), Br. Hyperlydian (mode IX.), Br. The fact that the term mode has been applied from very early times both to the ideal octave-forms, or true modes, and to the practical scales or tonalities based upon them has led to great confusion. Furthermore, the extant data of the subject are fragmentary and obscure, so that authorities differ widely. (The summary here given is taken chiefly from Alfred Richter.) The esthetic and moral value of the different modes was much discussed by the Greeks, and melodies were written in one or other of the modes according to the sentiment intended to be expressed. (2) The Gregorian, medieval, or ecclesiastical system was originally intended partly to follow the ancient system. Several of the old modes were retained, but subsequently received curiously transposed names. The system was initiated by Ambrose, Bishop of Milan, in the latter part of the fourth century, perfected by Gregory the Great about 600, and still further extended between the eleventh and sixteenth centuries. It exercised a deep influence upon the beginnings of modern music, and is still in use in the Roman Catholic Church. The ecclesiastical modes differ from each other both in the relative position of their "finals" or key-notes and in the order of their whole steps and halfsteps. They are authentic when the final is the lowest tone of the ambitus or compass, and plagal when it is the fourth tone from the bottom. Four authentic modes were established by Ambrose, the four corresponding plagal modes were added by Gregory, and six others were subsequently appended, making fourteen in all. In each mode certain tones are regarded as specially important—the final, on which phrases (other than the first and last) may begin and end: these are generically called modulations. All the modes are susceptible of transposition. Assuming the final of the first mode to be A, the full series is as follows (finals

3. (a) In Gregorian music, one of the tones in a mode with which every phrase of a melody in that mode must begin and end. The regular modulations of each mode include the final, the dominant, the mediant, and the participant, each of which has its own peculiar functions. (See these words, and also mode!.) To these are added two other tones in each mode, called conceded modulations, which are of minor importance. (b) In mod. music, the act, process, or result of changing, in the course of a piece, from one key (tonality) to another, so that a new tone becomes the key-note and the relative significance of all the tones common to both tonalities is altered. When a tone foreign to the original tonality of 3. (a) In Gregorian music, one of the tones in (tonality) to another, so that a new tone becomes the key-note and the relative significance of all the tones common to both tonalities is altered. When a tone foreign to the original tonality of a piece is used, a modulatory effect is nearly always produced. If this effect is carried out into a cadence in the new key, the modulation is called final; otherwise it is passing or transient. All modulations, however, require a return to the original key before the end of the plece. The tone by which the transition is introduced or effected is called the note of modulation; this tone in the simpler forms of modulation is usually the fourth or the seventh tone of the new key. The simplicity of a modulation depends upon the closeness of relationship between the keys involved. The simplest modulations are into the keys involved. The simplest modulations are into the keys either of the dominant or of the subdominant, and are effected by sharping the fourth tone or flatting the seventh tone respectively of the original key. Modulations into the relative minor or into the minor keys of the supertonic or of the mediant are effected by sharping the fifth, the first, or the second tone of the original key respectively. Numerous other more intricate modulations are possible, especially in instrumental music. A modulation is abrupt, distant, or extraneous, when it leads into a key not closely related with the original one. It is deceptive when it utilizes a series of chords in an unusual and startling way. It is metodic when produced by the introduction of a tone foreign to the original tonality, and harmonic when produced by the use of a chord common to both tonalities first in its relation to one and then in that to the other. It is enharmonic, when it is effected on an instrument of fixed intonation, like the pianoforte, by calling a key (digital) first by one name and then by another, as when E, in the key of B, is called D2 in the key of B2. Modulation is one of the most important resources of modern music. It introduces

In arch., a standard of measure often taken, particularly in antiquity and the middle ages, to regulate the proportions of an order or the disposition of an entire building. In the classical styles the diameter proportions of an order or the disposition of an entire building. In the classical styles the diameter or semidiameter of the column at the base of the shaft is usually selected as the module, and this is subdivided into parts or minutes, the diameter generally into sixty or the semidiameter into thirty. Some architects employ no fixed number of divisions of the module, but divide it into as many parts as they deem serviceable for the work in hand.

2. In Rom. and civil law, and early Eng. law, the manner or qualifying terms of a gift or dis-2. In Rom. and civil law, and early Eng. law, the manner or qualifying terms of a gift or disposition of property. The introduction of writing as the instrument of gift or transfer enabled donors to vary the customary legal consequences by expressing an intent as to the manner or mode in which the act should have effect; and that part of the instrument which thus qualified what otherwise would have been the ordinary legal effect was termed the modus, and the same term was used to designate the legal qualification thus imposed. Hence, more specifically—(a) The clause in a will or other gift (and the legal obligation created thereby) by which the donor charged an obligation upon the legatee or donee, not as a condition the breach of which would create a for fetture, but as a personal obligation, which the legatee would assume by accepting the gift. (b) Also, in early Eng. law, the clause in a conveyance enlarging or restricting the estate which otherwise would be granted by it, as for instance by giving to the donee and only a specified class of heirs. Hence the old common-law maximomous to oneento vincunt legem and modus legem dat donations, meaning specific qualification and express agreement override the law, or give the law to the transfer. (c) In secles. law, the exemption, or partial exemption, from the payment of tithes, termed modus decimands and modus non decimands respectively.

Molasse (mō-las'), n. [F., \ mollasse. flabby, \ mol, soft, \ L. mollis, soft.] In geol., a name given in Switzerland to an important geological formation belonging in part to the Miocene and in part to a position intermediate between the Eocene and the Miocene. The formation is in places over 6.000 feet thick, and chiefly of lacustrine origin. The fossil vegetation of the Molasse is of great interest, being subtropleal in character, containing palms of an American type, and also the conferous genus Sequoia, now limited to California. It is the upper member of the Molasse which contains these plant-remains, and this part of the series is made up of red sandstones, marls, and conglomerate (negelflub). The lower division of the Molasse is a sandstone containing marine and brackish-water shells.

S. Specifically, in founding, the form into which a fused metal is run to obtain a cast. Molds for metals and alloys having a low melting point, as lead, type-metal, Britannia metal, etc., are made of from or plaster of Paris, and may be used many times. Molds for the less fusible metals and alloys, as iron, brass, bell-metal, etc., are made in sand or loam and are divided into three classes: (a) Open molds, in which the pattern is impressed in the sand and withdrawn, and the molten metal is then poured in and finds itslevel. (b) Close molds, or molds in two parts called the drag and the case (or cope), forming together a two-part flask, one part being placed over the other, and each being impressed with one half of the matrix or pattern. See flask, 2. (c) Loam-molds, or molds built up with a core of brickwork or other material, and covered with founders loam. As in the case of open molds, with close molds a pattern, usually of wood, is used, being impressed one half at a time in the two parts of the flask or moldingbox, which, when put together so as to correspond, form the mold. Loam-molds are used especially in making large hollow castings, and do not require a pattern. These molds are of every shape and size, from molds for kettles and water-pipes to those for engine-cylinders and great cannon. Fine molds for making castings of insects, flowers, and other delicate objects are formed by suspending the object in a box by means of wires and covering it with plaster of Paris. When set the mold is heated until the object is burned, and the ash is then blown out, leaving the original shape in the mold. Another method is to fashion the figure in wax, bed it in plaster or

the mold. Another method is to fashion the figure in wax, bed it in plaster or clay, and then melt out the wax (cire perdu). In making plaster casts of parts of the human body, or of sculptors' models, theoriginal mold requires to be cut to remove it from the object, and the parts are afterward fitted together. Gelatin, papler maché, and sulphur are also used for making certain kinds of molds. The type-mold of type-founders is of steel in two pieces, making right and left halves, on the top of which, showing the face of the top of which, when conjoined, the matrix is attached. Every body of type has its special mold, which can be used for that body only, but the mold is made adjustable for the warying widths of type.

mold-board (mold'bord), n. 1. The curved board or metal-plate in a plow, which turns over the furrow.—2. In founding, the board on which the pattern for a mold is laid; a follow-board.

mold-box (möld'boks), n. A box used in casting steel under pressure for the manufacture ing steel under pressure for the manufacture of guns, etc. As devised by Sir Joseph Whitworth, this is a cylindrical box in which melted cracible steel or Siemens-Martin process steel is subjected to a hydrostatic pressure of 6,000 pounds per square inch. Two closely fitting hoops of steel of ample strength are fitted on the interior with cast-iron lags having vertical channels on the faces fitted to the hoops, and numerous channels leading from the vertical channels to the interior of the mold-box. The interior surfaces of the lags are lined with refractory sand. A central core of cast-iron faced with refractory sand, and provided with horizontal and vertical channels like the lags, is erected in the box, leaving an annular space into which the metal is run. By means of a hydraulic press an annular piston or plunger is driven down upon the upper surface of the molten metal. The gases which would otherwise be retained in the metal are thus forced out, escaping through the channels in the lags and the core.

For there was never man without our molding, Without our stamp upon him, and our justice, Left any thing three ages after him Good, and his own. Fletcher, Tamer Tamed, iii. 3. Anything cast in a mold, or anything formed

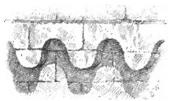

as if by a mold.—3. In arch., a member of construction or decoration so treated as to introduce varieties of outline or contour in edges or surfaces, whether on projections or in cavities, such laces, whether on projections or in cavities, such as on cornices, string-courses, bases, door- or window-jambs, lintels, etc. In classical architecture moldings are divided into three classes: the right-lined, as the fillet tenis, listel, regula; the curved, as the astragal or bead, the torus, the cavetto, the quarter-round, ovolo, and echinus; and the composite, as the ogee, talon, or cyma reversa, the cyma recta or doucine, and the scotia or trochilos, all of which are known by many synonymous names. In Roman architecture all curved moldings are formed of portions of circles, while in Greek architecture they are for the most part formed of some conic section, of which the curve, in good work, is always of extreme refinement. All these moldings are frequently entreme refinement. All these moldings are frequently entreme refinement.

riched by carving. In the architecture of the middle ages there is very great diversity in the form and arrangement of the moldings. In the Norman style they consist almost entirely of rounds and hollows, variously combined with splays and fillets, a striking peculiarity of this style being the recurrence of moldings broken into zigzag lines. In the succeeding English style, the early Pointed, the moldings are much lighter and more boldly cut. In the Decorated style of the fourteenth century there is still greater diversity, and this period is further characterized by the introduction of the roll-molding, and another termed the reas-molding. In the Perpendicular style large and often shallow hollows prevail, and the moldings are in general of fatter profile and less effective than those of earlier periods. The moldings of medieval architecture are very commonly sculptured with surface-ornament beautiful in design and elaborate in workmanship. See cuts under doging, and elaborate in workmanship. See cuts under doging, a molding, a molding passing entirely around the interior of a passenger-car, directly above the windows. Car-Budder's Dict.—Dovetsil-molding. See dovetail.—Embattled molding. molding-loam (möl'ding-löm), n. A mixture of clay and sand employed by founders in constructing molds for loam-molding.

molding-machine (möl'ding-ma-shēn'), n. 1. In wood-working, one of a class of high-speed power-machines for planing, recessing, shaping, molding, profiling, and paneling wood. Such machines occupy in wood working much the same position as the milling-machine in metal-work, as both operate by means of revolving cutters. In molding-machines all the work is performed by revolving cutter-heads having variously shaped knives. These cutters are used singly, as in some panel-machines, and project through the table on which the work is laid, or they are arranged in gangs and series so that the wood in passing through the machine is exposed successively to all the cutters. By this gang-system of cutters it is possible to cut moldings and edgings of the most complicated pattern. One form of the machine has the cutters between the cutter-arbor bearings, and is known as a matching-machine or wood-planing machine, or an inside-molding machine. In another form the cutters project up through the table and are arranged to work upon the inside edges of moldings. This type is known as the edge-molding machine. Sometimes called carving-machine, rariety-planer, or retigipaneling machine.

3. In sheet-metal working, a rolling-machine with shaped rollers of which one is the counterpart of the other, for molding sheet-metal into shape for cornices, balusters, etc.—4. In founding: (a) A machine for making loam-molds in flasks from small patterns carried by the machine. (b) A gear-molding machine.—Gear-molding machine, an apparatus for molding large gear-wheels from a pattern of a small section of the gear, as of two teeth and the interdental space.—Stone-molding machine, a machine for working stone moldings. It resembles one form of stone-saw, but differs from it in having the frame which carries the revolving grinder adjustable, by means of a screw beneath, to the thickness of the slab. The grinder is kept constantly supplied with moist sand.—Surface-molding machine, a form of molding-machine with double-edged cutters and a rapid reverse motion. It is used to cut scrolls and plain or molded designs on the surface of solid wood, to rout such work as ends of pews and stairs, to form grooves for inlaid work, to make tracings for carving, etc.

molding-mill (mol'ding-mil), n. A sawmill
or shaping-mill for timber.

molding-plane (mol'ding-plān), n. In joinery,
a plane used in forming moldings; a matchplane. Such planes have various patterns or convex and
concave soles for making the different parts of molding,
as hollows and rounds.

molding-plow (mol'ding-plou), n. A plow with
two mold-boards to throw the soil to both sides
at once; a ridging-plow. It is used in forming
ridges, in hilling potatoes, etc.

molding-saw (möl'ding-så), n. A circular saw or combination of circular saws for cutting out blocks approximating to the shapes of ornamental moldings. The molding is finished by cutters formed to the exact curve.

molding-table (mold'ding-ta"bl), n. A table on which a potter molds his ware. It has a trug or trough in which the workman moistens his hands, and a block-and-stock board on which he places the tile-mold. There are also four pegs driven into the table at the corners of the block-and-stock board, to sustain the mold and regulate the thickness of the tile.

molding-board (môl'ding-bōrd), n. Same as molding-board.

molding-box (môl'ding-boks), n. In foundry-work, a molding-flask.

molding-crane (môl'ding-krān), n. A crane adapted for use in a foundry in handling molds and flasks; a foundry-crane.

molding-cutter (môl'ding-kut'èr), n. A tool working on the principle of the plane-iron or cutter of a hand-plane, the edge of which is formed by a bevel on one side of the tool. The edges of molding-cutters are formed to correspond with the outline of the cross-sections of the moldings to be cut, each cutter being adapted to only one pattern of molding. Thus, to cut a molding of semicircular cross-section, the edge of the cutter must be a semicircle of the exact size of the molding. Such moldings were formerly cut by hand-planing, but this is now almost entirely superseded by power-planing machines with rotary cutters.

molding-file (môl'ding-fil), n. A large room in a ship-building yard in which the several parts of a ship are drawn out in their proper dimensions from the construction drawings. Also called modeling-loft.

[The] various problems [of laying-off] are solved upon the floor of a building known as the Mould Loft, where the drawing turnished by the designer are transferred in chalk lines in full size, and then by the aid of geometry, and in the manner discussed in the following pages, the draughtsman determines and draws in the shapes of the various components of the frame. molecule (mol'e-kūl), n. [< F. molecule = Sp. molecula = Pg. molecula = It. molecula, molecula, < NL. molecula, a molecule, dim. of L. moles, a mass: see mole3.] 1. The smallest mass of any substance which is capable of existing in a concrete form—that is the smallest mass. isting in a separate form—that is, the smallest part into which the substance can be divided without destroying its chemical character (identity). All the physical changes of a body, as the dissolving of sugar in water, the melting of lead, the change of water into steam, the magnetization of steel, and so on, are phenomena which take place without the loss of identity of the substance itself, and which concern the relations of the molecules among themselves. Hence the molecule is taken as the physical unit. A homogeneous body is regarded as made up of similar molecules, whose relations determine its physical qualities, and particularly its physical state as a gas, liquid, or solid. A gas, according to the kinetic theory of gases, is composed of molecules darting about in paths which are very nearly rectilinear through the greater part of their lengths. Liquids are supposed to be composed of molecules which wander about, but have not nearly rectilinear paths; while solids are believed to be composed of molecules bound together by cohesion and moving in quasi-orbital paths. A molecule of any substance is conceived as made up of one or more atoms, whose relations to each other are considered in chemistry. (See atom.) The exact nature of the molecules is still largely a matter of hypothesis, but as regards their size Sir William Thomson has reached a quasi-definite conclusion as follows: "If a drop of water were magnified to the size of the earth, the molecules or granules would each occupy spaces greater than those filled by small shot and smaller than those occupied by cricket-balls."

A molecule may consist of several distinct portions of matter held together by chemical bonds. . . So long as the different portions do not part company, but travel together in the excursions made by the molecule, our theory calls the whole connected mass a single molecule.

Clerk Maxwell, Heat, p. 296.

The molecule of any substance is, by some chemists, defined as being the smallest portion which, so long as the substance is che isting in a separate form—that is, the smallest part into which the substance can be divided

molt<sup>2</sup>, moult<sup>1</sup> (môlt), n. [(molt<sup>2</sup>, moult<sup>1</sup>, v.] 1.

The act or process of shedding or easting any tegumentary, cuticular, or exoskeletal structures or appendages, as feathers, hair, skin, nails, horns, hoofs, claws, or shell; ecdysis; mails, horns, hoofs, claws, or shell; ecdysis; exuviation. The surface of the body of most animals, outside of the parts which are vascular or supplied with blood, is worn away by friction, attrition, or other mechanical means. This process may be slight and gradual or continuous, as in the case of man, where it results in scarfakin and dandruff; or it may be periodical and very extensive, affecting the whole cuticle or its appendages. Mammals shed their hair usually once a year. Birds moit their feathers usually at least once, often twice, sometimes thrice a year, the last two cases constituting the double and the triple molt. Both these classes of animals, in some cases, molt cuticular substances in mass. Thus, the American antelope sheds the sheath of the horn; lemmings and ptarmigans drop their claws; some birds of the suk family shed the horny parts of the beak; anakes cast their cuticle whole, even to the layer over the eyeball; crustaceans slough the whole shell; and numberless other in the contracter.

molybdenum (mol-ib-de'num), n. [(NL. molybdenum, a later form for L. molybdæna: see molyb-dena.] Chemical symbol, Mo; atomic weight, 95.8. A metal of a silver-white color, but hard-er than silver, which fuses with difficulty, if at er than silver, which fuses with difficulty, if at all, at the highest temperature of a wind-furnace. Its specific gravity is 8.6. It is chemically related to chromium, tungsten, and uranium, and, like those metals, forms trioxids which are acid-forming and yield very characteristic salts. It is remarkable for the number of oxids and corresponding chlorids which it forms; but it is the least important economically of the group to which it belongs. The most abundant ore of molybdenum is the sulphuret (molybdenite), and the strong external resemblance of this mineral to graphite (Latin plumbago) led to the confusion of molybdena with that substance; moreover, external resemblance and certain chemical peculiarities caused still further difficulties of nomenclature, in which manganese, antimony, and even magnesis were involved. Thus, the peroxid of manganese was called by Linneus molybdarum magnesis. These perplexities were not cleared up until toward the end of the last century; but finally, as the result of the labors of Scheele, Bergman, and Hjelm (1778-90), the metal

molybdena, or molybdenum, as it is now more generally called, was isolated from its combinations. The ores of molybdenum are somewhat widely diffused, but rarely occur in any considerable quantity. The principal molybdeniferous minerals are molybdenite and wulfenite. There is also a molybdic ocher (the trioxid) and a carbonate (pateraite); various ores of iron also contain traces of this metal.

momentum (mō-men'tum), n.; pl. momenta (-tā). [< L. momentum, balance, alteration, cause, etc., orig. 'a movement': see moment.]

1. In mech., the product of the mass and velocity of a body; the quantity of motion of a body. In all relations between bodies, such as impacts, the algebraic sum of the momenta is preserved constant. See energy.

When the velocity is the same, . . . the momentum, or moving force, of bodies is directly proportional to their mass or quantity of matter. . . . When the momenta of two bodies are equal, their velocities will be in the inverse proportion of their quantities of matter.

Lardner, Handbook of Nat. Philos., §§ 195, 199.

The rate of mass displacement is momentum, just as the rate of displacement is velocity.

Clerk Maxwell, Matter and Motion, art. lxvii.

2. An impulse; an impelling force; impetus.

This preponderating weight . . . compleated that momentum of ignorance, rashness, presumption, and lust of plunder which nothing has been able to resist.

Burke, Rev. in France.

He never asks whether the political momentum set up by his measure, in some cases decreasing but in other cases greatly increasing, will or will not have the same general direction with other like momenta.

Momordica (mō-môr'di-kš), n. [NL. (Tournefort, 1700), so called in allusion to the seeds, fort, 1700), so called in allusion to the seeds, which have the appearance of being bitten; (L. mordēre (perf. momordi), bite: see mordant.] A genus of plants of the natural order Cucurbitaceæ and the tribe Cucumerineæ, characterized by the stamens being inserted below the mouth of the calyx, by the calyx being provided with two or three scales, and by having a camwith two or three scales, and by having a campanulate corolla and simple tendrils. They are climbing herbs, either annual or perennial, having entire lobed or compound leaves and rather small white or yellowish flowers, which are monoccious or diocious. The fruit is oblong or cylindrical, berry-like or opening into three valves, having few or many seeds. Twenty-five species are known, natives chiefly of Africa, but also of tropical Asia and Australia. They are plain plants except for their fruit, which in some species is red or orange-yellow, and which bursts when fully ripe, disclosing the red-ariled seeds. Such are the species M. Balsamina, the balsamapple, and M. Charantia, sometimes called balsam-pear, the best-known cultivated species. The squirting cucumber, which grows in the south of Europe, was formerly placed in this genus, under the name M. Elaterium, but is now regarded as the type of a distinct genus, Ecballium.

The root-idea of monachim is . . . retirement from society in search of some ideal of life which society cannot supply, but which is thought attainable by abnegation of self and withdrawal from the world. This definition applies to all forms of monachim, . . . whether amongst Brahmans, Buddhists, Jews, Christians, Moslems, or the communistic societies of the present day, even when theoretically anti-theological. This broad general conception of monachim is differenced in the following ways:—It may take the form of absolute separation, so far as practicable, from all human intercourse, so as to give the whole life to solitary contemplation—the anchoretic type; or it may seek fellowship with kindred spirits in a new association for the same common end—the cenobitic type; it may abandon society as incurably corrupt, as a City of Destruction out of which the fugitive must fice absolutely—the Oriental view, for the most part; or it may consider itself as having a mission to influence and regenerate society—which has been, on the whole, and with minor exceptions, the Western theory of the monastic life.

monad (mon'ad), n. and a. [= F. monade = Sp. monada = Pg. monada = It. monade, < LL. monas (monad-), < Gr. μονάς (μοναό-), a unit, unity, as adj. solitary, single, < μόνος (Ionic μοῦνος, Doric μῶνος, orig. \*μον Ϝος), alone, solitary, single, sole, only; appar. akin to μία, fem. of είς (εν-), one.] I. n. 1. In metaph., an individual and indivisible substance. The word was introduced into philosophy by Glordano Bruno to denote the minimum parts of substances supposed by him to be at once psychical and material. In the philosophy of Leibnitz the conception of the monad is that of an absolutely unextended substance existing in space, its existence consisting in its activities, which are ideas; and the universe was conceived by him as made up of such existences. The history of each

monad follows an internal law, and all interaction between the monads is excluded; but there is a preestablished har-mony between these laws for the different monads. (See Leibnizian.) The Leibnizian theory of the monad was, in many particulars, revived by Hermann Lotze.

Pythagoras his monads, so much talked of, were nothing else but corporeal atoms.

Cudworth, Intellectual System, p. 13.

Cudworth, Intellectual System, p. 18.

The soul is a monad (according to Bruno). It is never entirely without a body. God is the monad of monads; he is the minimum, because all things are external to him, and at the same time the maximum, since all things are in him. . The atoms of the ancients differed from one another in magnitude, figure, and position, but not qualitatively or in internal character. The monads of Leibniz, on the contrary, are qualitatively differentiated by their ideas. All monads have ideas, but the ideas of the different monads are its fulgurations. . God is the primitive monad; all other monads are its fulgurations. Ueberney, Hist. Philos. (tr. by Morris), II. 27.

Monarchian (mō-nār'ki-an), n. [= F. mo-narchien = Pg. monarchiano; < Gr. μονάρχης, monarch, μοναρχία, monarchy: see monarchy and -an.] One of a body of Antitrinitarian Christians in the latter part of the second and the third century. They were divided into two groups—
the dynamic (dynamistic) or rationalistic Monarchians,
who regarded Christ as filled with a divine power and denied his divinity, and the Patripasians, who regarded the
Father and the Son as the same; the latter were called
modalistic Monarchians, from their advocacy of a threefold
mode or manifestation of the deity.

By monarchians of the former [dynamistic] class Christ was held to be a mere man, miraculously conceived indeed, but constituted the Son of God simply by the infinitely

high degree in which he had been filled with Divine wisdom and power.

Encyc. Brit., XVI. 719.

Monarchianism (mō-nār'ki-an-izm), n. [< Mo-narchian + -ism.] The theological doctrine respecting the Godhead maintained by the Monar-

chians.

Modalistic monarchianism, conceiving that the whole fulness of the Godhead dwelt in Christ, took exception to the "subordinatianism" of some church writers, and maintained that the names Father and Son were only two different designations of the same subject, the one God, who "with reference to the relations in which He had previously stood to the world is called the Father, but in reference to His appearance in humanity is called the Son."

2. The principle of government by a monarch; the monarchical system.

The first, the most ancient, most general, and most approved, was the government of one ruling by just laws, called monarchy.

Raleigh, Hist. World, I. ix. 2.

I hear there are people among you who think the experience of our governments has already proved that republican governments will not answer. Send those gentry here, to count the blessings of monarchy.

Jefferson, Correspondence, II. 221.

3. A government in which the supreme power is either actually or nominally lodged in the hands of a monarch or sole ruler, who holds his posi-tion for life, generally with hereditary succesof a monarch or sole ruler, who holds his position for life, generally with hereditary succession. There have been elective monarchies, in which the successor to a deceased covereign was chosen without obligatory regard to the hereditary principle; but this principle has finally prevailed, to the exclusion of choice, in all existing civilized monarchies. The former kingdom of Poland was a purely elective monarchy. The German-Roman empire was originally, and always nominally, elective; but for many centuries the chosen successor was almost invariably the heir of the former emperor. An absolute or despote monarchy is one in which the will of the monarch or sovereign is supreme over all other authority or powers of government; a limited or constitutional monarchy, one in which the sovereign is limited to the exercise of particular powers or functions by the laws or constitution of the realm. More or less limited monarchies have nearly always existed. About the fifteenth century a noteworthy increase of the power of the sovereign took place (as in England under Edward IV., in France under Louis XI., in Spain under Ferdinand the Catholic and Charles V.). Till the close of the eighteenth century the prevalent theory and practice on the continent constituted nearly unrestricted absolutism; this has now almost disappeared from Europe, while still maintaining a foothold in Asia. But whether absolute or limited, the monarch is theoretically regarded as the source of all power, and all acts of government are done in his name.

The obvious definition of a monarchy seems to be that of a state in which a single person, by whatsoever name he may be distinguished, is intrusted with the execution of the laws, the management of the revenue, and the command of the army. But, unless public liberty is protected by intrepid and vigilant guardians, the authority of so formidable a magistrate will soon degenerate into despotism.

Gibbon.

It has often indeed been noticed that a Feudal Monar-chy was an exact counterpart of a Feudal Manor, but the reason of the correspondence is only now beginning to dawn upon us. Maine, Early Hist. of Institutions, p. 77. 4. The territory ruled over by a monarch; a kingdom; an empire.

Monarda (mō-när'dä), n. [NL. (Linnæus, 1737), named after N. Monardés, a Spanish physician and botanist of the 16th century.] A genus of labiate plants, type of the tribe Monardee, characterized by the anthers hav-

ing a very small connective, the cells confluent into one, and by having a tubular calvx with fifteen nerves, which is almost equally five-toothed. They are odorous erect herbs with entire or toothed leaves, and quite large flowers arranged in a few terminal or whorled heads, surrounded by many bracts, and varying in color, being bright-red, purple, white, and in one species pale-yellow. About 7 species are known, all natives of North America. M. punctata, the American horsemint, is stimulant and carminative. M. didyma, the Oswego tea, or bee-balm, has bright-scarlet flowers and is handsome in gardena.

source.] A house or other place of residence source.] A house or other place of residence occupied in common by persons seeking religious seclusion from the world: commonly apgious seclusion from the world: commonly applied to such a house exclusively used by monks. The term, however, strictly includes the abbey, the priory, the nunnery, and the friary, and in this broad use is synonymous with convent. Monasteries in the Christian church were probably first established in the fourth century. St. Benedict of Nursia in the sixth century established a monastic rule which has been the foundation of nearly all the rules which govern monastic vows. Vows under different rules were made from the beginning of Christianity. The

number of monasteries in Europe was much diminished at the Reformation, when their rich estates were in part appropriated by sovereigns to their own use, and in part transferred to universities and other educational institutions, etc. We owe to the monasteries the first definite beginnings or revival of civilization in many countries, especially Germany and France, almost all the missionary work of the early middle ages, and the preservation of nearly all ancient classical and early medieval literature. The monastic life has been practised from pre-Christian times among the Buddhists. See rule.

The Monera are apparently structureless particles of protoplasm, agreeing with other rhizopods in protruding pseudopods, but differing from the normal amebolds in lacking any recognizable nucleus. Unlike foraminifers, they form no shell. The group is provisional, and perhaps hypothetical. The name is that of alegitimate biological conception; but since it is by no means certain that every moner is not a stage or state of a somewhat more definitely organized rhisopod, the group so named has no assured zoological standing. The Monera are sometimes nominally divided into Gymnomonera and Lepomonera, the former of which are always naked, while the latter may acquire a cell-wall. Also Monerozoa.

MS. Cantab. Ff. v. 48, f. 53. (Halliwell.)

Every man also gave him a piece of money. Job lxii. 11.

2. In a wider sense, any article of value which is generally accepted as a medium of exchange; also, by extension, something which, though possessing little or no intrinsic value, is recognized and accepted as a substitute for money as above defined, such as paper money; any circulating medium of exchange. Money is adopted for the sake of convenience to facilitate the exchange of one kind of wealth for another and as a standard of value. Its common form is that of a stamped metallic currency; but in primitive times, among uncivilized peoples, and under special conditions by civilized people, many other articles have been used as money. Bank-notes, greenbacks, gold and silver certificates of the United States government, etc., all representing coin, are called paper money, and are used for convenience instead of the coin

Every man also gave him a piece of money. Job lxii. 11.

See the quotation.

It will be well to deal with a use of the phrase value of money which has led to much confusion. In mercantile phraseology the value of money means the interest charged for the use of loanable capital. Thus, when the market rate of interest is high, money is said to be dear, when it is low, money is regarded as cheap. Whatever may be the force of the reasons in favour of this use, it is only mentioned here for the purpose of excluding it. For our present subject, the value of a thing is what it will exchange for; the value of money is what money will exchange for, or its purchasing power. If prices are low, money will buy much of other things, and is of high value. The value of money is inversely as general prices, falling as they rise and rising as they fall.

[Also written mongoose, mongooz, mongouz, mongoz, mongouz, mongus, mungoose, etc.; F. mongouz, M. specific name mongooz; < Telugu mangsu, Marathi mangus, a mongoos.] 1. A common ichneumon of India, Herpestes griseus. Being easily domesticated, it is kept in many houses in Hindustan to rid them of reptiles and other vermin, as rats, mice, etc. It has been said that it neutralizes the polson of snakes, which it fearlessly attacks, by eating, during its contests with them, the Ophiorhiza Mungos, but its immunity is really due to the extreme celerity of its movements. It is of a gray color, flecked with black, and about the

size of a cat. The name is commonly extended to all the related ichneumons of the subfamily Herpestinæ, of which there are several genera and many species; and also to some of the Viverrinæ. All these belong to one family, Viverridæ. See Herpestes, and cut at ichneumon.

An individual or a breed of animals resulting from repeated errosing or animals resulting from repeated crossing or mixture of several different varieties; the progeny of varieties, and especially of artificial varieties, as distinguished from the hybrid, or cross between two different species (but the distinction is not always observed).

This greater variability in mongrels than in hybrids does not seem at all surprising. For the parents of mongrels are varieties, and mostly domestic varieties, . . . and this implies that there has been recent variability, which would often continue and be added to that arising from the act of crossing.

Monimia (mō-nim'i-ä), n. [NL. (Du Petit-Thouars, 1804), suggested by its affinity to a genus previously named Mithridatea, < L. Monima, < Gr. Μονίμη, wife of Mithridates.] A genus of dicotyledonous apetalous plants, type of the natural order Monimiaceæ and of the tribe Monimiaca.

dicotyledonous apetalous plants, type of the natural order Monimiaceæ and of the tribe Monimieœ. It is characterized by globose dioctous flowers, the staminate becoming split into four to six lobes, by numerous stamens, each bearing two glands at its base, and by the fruit, which consists of several very small one-seeded drupes inclosed within the enlarged perianth. Three species are known, natives of the Mascarene Islands. They are shrubs with rigid opposite leaves, and very small flowers, closely clustered in the axils. Fossil plants of this genus occur in the Tertiary formations of Europe and of Australia, and closely allied forms, called Monimiopsis, at the very base of that formation in France and in the Fort Union group on the Yellowstone river in Montans.

Monimiaceæ (mō-nim-i-ā'sē-ē), n. pl. [NL. (Endlicher, 1836), \( \frac{Monimia}{Monimia} + \tacea. \) A natural order of dicotyledonous plants of the apetalous series Micrembryeæ, typified by the genus Monimia. It is characterized by a globose or cup-shaped perianth, toothed or deeply divided at the border, by numerous stamens covering the perianth, and by having several or many distinct ovaries, each with a single ovule, a minute embryo, and copious fleshy albumen. The order includes about 22 genera and 150 species, natives of the warmer parts of South America, Asia, and the South Pacific islands. They are trees, shrubs, or rarely climbers, generally aromatic, with rigid opposite leaves and small flowers, in axillary or sometimes terminal clusters, which are shorter than the leaves. Several furnish wood for building and cabinet-work, or leaves used as a tonic or an aromatic seasoning.

It is characterized by having pendulous ovules, and anthers opening by a longitudinal fissure (instead of uplifting valves as in the other tribe of the order, Atherospermæ). It includes 8 genera, natives of tropical America, Australia, and adjacent islands, with one genus in Africa.

physical and spiritual worlds from a single principle; specifically, the metaphysical doctrine that there is but one substance, either mind (idealism) or matter (materialism), or a substance that is neither mind nor matter, but is the substantial ground of both: opposed to duthe substantial ground of both: opposed to dualism. The term was applied by Wolf, its inventor, to the forms of the doctrine which were then known, namely, to the denial of the substantiality either of mind or of matter; but it is now extended to the doctrine that the distinction between physical and mental facts is only phenomenal, and that in themselves they are not distinguished. Many special modifications of monistic speculation, especially on its materialistic side, have accompanied the recent developments of physical science, particularly the doctrine of evolution. (See quotation from Haeckel under monistic.) Such doctrines as that energy, electricity, etc., are categories of substance different from matter are not taken account of by those who use the term, so that it is not easy to say whether they would be considered as denials of monism or not. Also called unitism and unitarianism.

anism.

Monism led a miserable existence in philosophical dictionaries, until, as a denotation of the Hegelian philosophy, it obtained a very wide use. It had again in some measure fallen out of use when it was taken up by modern natural philosophy, and made the watchword of a doctrine which considers mind and matter neither as separated nor as derived from each other, but as standing in an essential and inseparable connection.

of monism in some one of its forms.

The philosophical unitarians or monists reject the testimony of consciousness to the ultimate duality of the subject and object in perception, but they arrive at the unity of these in different ways. Some admit the testimony of consciousness to the equipolise of the mental and material phenomena, and do not attempt to reduce either mind to matter, or matter to mind. They reject, however, the evidence of consciousness to their antithesis in existence, and maintain that mind and matter are only phenomenal modifications of the same common substance. This is the doctrine of absolute identity—a doctrine of which the most illustrious representatives among recent philosophers are Schelling, Hegel, and Cousin. Others again deny the evidence of consciousness to the equipoise of subject and object as coordinate and original elements; and, as the balance is inclined in favor of the one relative or the other, two opposite schemes of psychology are determined. If the subject be taken as the original and genetic, and the object be evolved from it as its product, the theory of idealism is established. On the other hand, if the object be assumed as the original and genetic, and the subject be taken as the original and genetic, and its evolved from it as its product, the theory of materialism is established.

instead.

Bibliotheca Sacra, XLV. 108. The opponents of the doctrine of evolution are very fond of branding the monistic philosophy grounded upon it as "materialism," by confusing philosophical materialism. Strictly, however, our monism might, as accurately or as inaccurately, be called spiritualism as materialism. The real materialistic philosophy asserts that the vital phenomena of motion, like all other phenomena of motion, are effects or products of matter. The other, opposite extreme, spiritualistic philosophy, asserts, on the contrary, that matter is the product of motive force, and that all materialistic philosophy.

terial forms are produced by free forces entirely independent of the matter itself. Thus, according to the materialistic conception of the universe, matter or substance precedes motion or active force. According to the spiritualistic conception of the universe, on the contrary, active force precedes matter. Both views are dualistic, and we hold both of them to be equally false. A contrast to both views is presented in the monistic philosophy, which can as little believe in force without matter as in matter without force.

Communities of a more or less monastic character in Palestine and Egypt before the diffusion of Christianity were the Essenes and Therapeute (which see). The ordinary Christian life of the first three centuries, even when not celibate, was largely ascetic and in communities. Christian monasticism in a definite form originated in Upper Egypt in the third or fourth century (perhaps with St. Anthony; according to other accounts it is traced to the ascetic Paul, about A. D. 250). The first monks were anchorites, living in solitude. The collection of anchorites in a monastery (laura or comobium) is ascribed to Pachomius, in the fourth century. The institution spread rapidly, and was greatly helped in the West by the establishment of the Benedictine order in the sixth century. Various developments of the monastic system are to be found in the middle ages, as the military orders, friars (often distinguished from monks proper), etc. Since the Reformation, and especially since the French revolution, monachism has declined in Western countries, or has been overshadowed by the society of Jesuits, but still continues to flourish in Eastern churches.

or Common Green Monkey (Cercopithecus sabieus).

simian; any one of the Primates except man and the lemurs; an ape, baboon, marmoset, etc. The term is very vague, and has no technical or fixed restriction. Those monkeys which have very short tails and faces are commonly called apes, most of them belonging to the higher family Simidas. The monkeys with long faces like dogs are usually termed baboons; they are at the bottom of the series of Old World simians, in the family Cynopithecidas. The small bushy-tailed monkeys of America are usually known as marmosets. Excluding these, the name monkey applies mainly to long-tailed simians of either hemisphere. All the Old World monkeys, in any sense of the word, are catarrhine, and have 32 teeth, as in man. They constitute two families, Simidae and Cynopithecidae. (See cuts under Ceropithecus, Catarrhina, and Diana, 2.) All the New World monkeys are platyrrhine: there are two families, Cebidae, with 86 teeth and mostly prehensile tails, and Middae or marmosets, with 32 teeth and bushy non-prehensile tails. (See cuts under Cebinae, Eriodes, and Lagothriae.) The genera of monkeys are about 36 in number, including several that are fossil. The species are particularly numerous in Africa and South America, especially in the tropical parts. There are many, however, in the warmer parts of Asis, and even up to the snow-line; a single one is found in Europe, the Barbary ape, Innus ecaudatus. (See cut at ape.) Almost all the leading species have specific names in the vernacular as well as their technical scientific designations. simian; any one of the Primates except man and

The position of the bridge required to produce particular intervals may be mathematically determined, and marked on the body of the instrument. The monochord has been much used in acoustical demonstration and in teaching pure intonation. In the middle ages smaller instruments with several strings were made, and were often permanently tuned to give certain intervals. (See helicon (a).) The notion of a primitive keyboard-instrument doubtless sprang from some such beginning.

tion: said of a zone of stratified rocks throughout which the strata all incline toward the same point of the compass. The term was introduced by H. D. Rogers (1842), and has taken the place of Darwin's hybrid word unictinal: thus, monodinal valley (a valley bounded by ridges the strata of which all dip in the same direction); monodinal ridge; monodinal flexure, etc. A monodinal flexure may be regarded as a half of an anticlinal fold, which would have been completed had the flexing action not been limited to one side of the axis, the strata resuming their horizontality on the other side.

The Echo-Cliff flexure, the Water-Pocket flexure, one of the grandest monoclinals of the west, and the San Rafaei flexure, all monoclinal flexures of imposing dimensions and perfect form, Capt. Dutton considers go far back in Ter-tiary time, and possibly are pre-Tertiary. Reade, Origin of Mountain Ranges, p. 250.

Monocondyla (mon-ō-kon'di-lä), n. pl. [NL., ζ Gr. μόνος, single, + κόνδυλος, a knuckle, joint, knob: see condyle.] The Reptilia and Aves (reptiles and birds) collectively: so called from the single occipital condyle characteristic of these classes among the higher vertebrates. The term indicates a group exactly conterminous with Sauropsida. Opposed to Amphicondyla. monocondylar (mon-ō-kon'di-lär), a. Same as monocondylan.

monocondylian (mon'ō-kon-dil'i-an), a. [As Monocondyla + -ian.] Having one occipital condyle, as the skull of birds, reptiles, and some fishes: distinguished from dicondylian.

monocotyledon (mon-ō-kot-i-lē'don), n. [⟨Gr. μόνος, single, + κοτυληδών, a hollow, a sucker, etc.: see cotyledon.] A monocotyledonous plant; an endogen. See endogen, and cut under cotyledom

Monocotyledones (mon-ō-kot-i-lō'don-ēz), n. pl. [NL. (Ray, 1703), < Gr. μόνος, single, + κοτυληδών, a cup-shaped cavity: see cotyledon.] A natural class of flowering plants, having a single seed-leaf or cotyledon in the embryo. They have generally the parts of their flowers in threes (not in fives, as in dicotyledons), their earliest leaves alternate, and the veins parallel. From the structure of the stem, increasing by internal or endogenous growth, they are also called endogens. The wood of their stems occurs in longitudinal bundles of fibers, scattered, as in Indian corn, or becoming compact, as in palma. New bundles of fibers form between the old, not, as in dicotyledons or exogens, in an annual external layer enveloping the stem. The class is divided into 34 orders, among which are the lily, iris, smaryllis, orchis, banans, palm, pineapple, screwpine, arum, rush, sedge, and grass families. By Bentham and Hooker these are classed in seven groups or series; by

tham and Hooker & groups or series; by others in three, the spadiesous, petaloideous, and glumaceous divisions. About 20,000 species are known, included in about 1,500 genera.

Monodelphia (mon-ō-del'fi-ĕ), n. pl. [NL., < Gr. μόνος, single, + ἀελφίς, womb.] The highest of three primary divisions of mammals, or subclasses of the class Mammalia (the other two being Didelphia and Ornithodelphia); placental mammals, or Placentalia. The subclass contains all mammals except the marsupials and monotremes. The young are retained in the womb by means of placental attachment till they are well developed; the scrotum is never in front of the penis; and the uterus and vagina are never paired. The brain has a well-developed corpus callosum, and comparatively small anterior commissure. The Monodelphia are variously divided into an upper and a lower series, Educabilia or Microsthena; or into Archencephala (man alone), Grencephala, and Lissenephala; or directly into a number of orders. The orders of living monodelphians now usually adopted are eleven: Primates, Feræ, Unquiata, Hyracoidea, Proboscidea, Sirania, and Cete, of the upper series; and Chiroptera, Insectiora, Glires (or Rodentia), and Bruta (or Raentata), of the lower series. The families are about 120 in number. Eutheria is a synonym. Also, wrongly, Monadelphia. have only one eye—that is, two eyes coalesced in one. These "apterous insects" were entomostracous crustaceans. Monoculus and some other entomostracous were afterward made by Latreille his first order of Entomostraca, called Branchopoda and divided into two principal sections, Lophyropoda and Phyllopoda.

in contradistinction to the orthodox doctrine that by the incarnation two complete and perfect natures, the divine and the human, are united without confusion or mutation in the one person of Christ. Among Monophysites in the wider sense are included the Eutychians and Monothelites. The sect of Eutychians was founded by Eutyches, who was condemned at the Council of Chalcedon, A. D. 461. They taught that there is but one nature in Christ, the divine. The Monophysites properly so called hold that the divine and human natures in Christ are combined into one composite nature. The first leaders of the Monophysites, and founders of the present Monophysite or Coptic Church of Egypt, were Dioscorus, condemned at Chalcedon (died A. D. 464), and Timothy Ælurus ('Cat'), made patriarch A. D. 457. In later times their most important leader was Severus, about A. D. 520, whose followers were called Severians, Corrupticolae, or Phthartolatrae, while those of an opposite Monophysite sect were known as Julianists, Aphthartodoctae, and Phantasians. In the sixth century the Monophysites spread widely in Syria, and were named Jacobites, from Jacob Beradeus, Bishop of Edessa, 541–78. At various times the Monophysites divided into a great number of sects, known by more than thirty different titles. These represented different shades of original Eutychianism and Monophysitism and attempts at approach to orthodoxy. The most subtle form of Monophysitism is at the opposite pole of doctrine to Nestorianism, the orthodox doc aclied Diphysites and Melchites. At the present day the two great bodies of Monophysites are the Copts and the Syrian Jacobites. The Armenian Church is also often regarded as Monophysite of Edesac, Theopachte, Trükeise.

In Owen's classification, a "subclass of Reptilia," containing all reptiles which breathe in one way only—that is, by lungs: distinguished from Dipnoa or Branchiotoca, which breathe in two ways—that is, either by gills first and lungs afterward in the case of the same individual, or some of them by gills and others by lungs. afterward in the case of the same individual, or some of them by gills and others by lungs. In this scheme, not easy to define satisfactorily, Prof. Owen makes his "class Reptilia" cover not only Reptilia in the usual sense, but also Amphibia or Batrachia. His Dipnoa are then conterminous with Amphibia proper. He divides Monopnoa into the orders Pteroscuria, Dinoscuria, Crocodilia, Chelonia, Lacertilia, Ophidia, Anomodontia, Scuropterygia, and Ichthyopterygia. Comp. Anal. Vert. (1868), III. 850.

monopoly (mō-nop'ō-li), n.; pl. monopolies (-liz).
[= F. monopole = Sp. Pg. It. monopolio, < L. monopolium, < Gr. μουοπώλιου, a right of exclusive sale,  $\mu o \nu o \pi \omega \lambda i a$ , exclusive sale, monopoly,  $\langle \mu \delta \nu o \varsigma$ , sole,  $+ \pi \omega \lambda e i \nu$ , barter, sale.] 1. An exclusive privilege to carry on a traffic.

Monopolies are much the same offence in other branches of trade that engressing is in provisions, being a license or privilege allowed by the king for the sole buying and selling, making, working, or using of any thing whatsoever; whereby the subject in general is restrained from that liberty of manufacturing or trading which he had before.

Blackstone, Com. (ed. Waite), IV. 159.

2. Specifically, in Eng. constitutional hist., and hence sometimes in Amer. law, such an exclusive privilege when granted by the crown or state to an individual, association, or corporation, for the sake of the pecuniary advantage of tion, for the sake of the pecuniary advantage of its exclusiveness. A privilege not granted by the state, but secured by burjug up the article, is termed by the Beglish law engrossing. The legal objection to a monopoly, in this sense of the word, is that it can be secured only by forbidding all other citizens except the favored grantee to exercise a common-law right. Exclusive privileges granted by the state to a limited number of persons for the sake of enabling the state the better to regulate the traffic for the protection of the rest of the community, as in case of banking franchises, liquor traffic, etc., are not deemed monopolies, although the same privileges would be, if conferred on a single or a very tew grantees, for the sake of the pecuniary benefit to them. So the exclusive privileges conferred on inventors and authors, by the patent and copyright laws, for the sake of the encouragement of the arts and literature, and extending only to articles originally devised under that encouragement, are not deemed monopolies. Both these classes of grants have, however, been condemned by some as partaking of the character of monopolies.

lies.

If any man, out of his own wit, industry, or endeavour, find out anything beneficial to the Commonwealth, or bring out any new invention which every subject of this kingdom may use, yet, in regard of his pains and travel therein, her Majesty perhaps is pleased to grant him a privilege to use the same only, by himself or his deputies, for a certain time. This is one kind of Monopoly. Sometimes there is a glut of things, when they be in excessive quantity, as perhaps of corn; and perhaps her Majesty gives licence of transportation to one man. This is another kind of Monopoly. Sometimes there is a scarcity or a small quantity; and the like is granted also.

Bacon, in E. A. Abbott's Account of his Life and Works.

I will have no private monopolies, to enrich one man, and eggar a multitude.

Burton, Anat. of Mel., To the Reader, p. 68. He thinks he can never trade to his advantage unless he can have the monopoly of everything he values. South.

3. In polit. econ., and as used in a general sense in law, such an exclusive privilege to carry on a traffic, or deal in or control a given class of articles, as will enable the holder to raise prices materially above what they would be if the trafmaterially above what they would be if the traffic or dealing were free to citizens generally. In this sense, that exclusive control of a particular kind of product which results from the legitimate ownership of the only land from which it can be obtained, as in the case of some mineral waters, or earths, or ores, is sometimes spoken of as a natural monopoly, in contrast to the artificial monopoly below.

4. That which is the subject of a monopoly as, in Bengal opium is a monopoly.—5. The possession or assumption of anything to the exclusion of other possessors: thus, a man is popularly said to have a monopoly of any business of which he has acquired complete control.

6. Loosely, a company or corporation which enjoys a monopoly.—Monopoly Act, an English statute of 1623 (21 Jas. I., c. 3), declaring all monopolies for the manufacture, sale, or use of anything to be void, excepting to inventors their patent rights. Also known as the Statute of Monopolies.—Virtual monopoly, a term in constitutional law and the history of legislation (the appropriate applications of which have been much contested used to characterize a business which, though not declared by law to be a monopoly or exclusive franchise protected as such, as by a patent or an exclusive charter, is yet so related to the great channels and currents of commerce that the allowing of it to enjoy the same protection as other private property and business secures to it indirectly exclusive advantages substantially equivalent to a legal monopoly. Thus the great grain-elevators of modern commerce, although erected as private property on private lands, if by their situation they have exclusive advantages for the transfer of grain from vessels at the wharf to the railroad terminus of a trunk-line, are said to constitute a virtual monopoly, because, if not subjected to a legislative power to restrict their charges such as other private property and business are not subjected to, they might be conducted in a manner oppressive to commerce.

In mammal., the lowest order of the class Mammalia, containing those mammals which have malia, containing those mammals which have a single or common opening of the genital, urinary, and digestive organs, and are oviparous. The order coincides with the subclass Ornithodelphia, and also with Prototheria and Amasta; it is divided into two suborders, Tachyglossa and Platippoda, respectively constituted by the families Tachyglosside (or Echidnide) and Ornithorhynchides (or Platippodade). There are mammary glands, but no nipples. There is a common cloaca, into which empty the sperm-ducts, oviducts, and ureters, and which also receives the feces, as in birds; and the females lay eggs like those of reptiles. The testes, like the ovaries, remain abdominal. There is a peculiar T-shaped episternum or interclavicle, and the coracoid joins the sternum, as in birds. (See cut at interclavicle.) There are no true teeth. The very peculiar mammals which constitute this order are the duck-mole or duck-billed platypus, Ornithorhynchus paradozus, and several species of so-called spiny ant-eaters, of the genera Echidnid or Tachyglossus and Zaglossus or Acanthoglossus. See cuts under duckbill and Echidnides.

In logic, a variety of syllogism depending on the quantity (universal or particular) and qualmoolah, moollah (mö'lä), n. Same as molla. ity (affirmative or negative) of the propositions moolberyt, n. A Middle English form of multhe quantity (universal or particular) and quality (affirmative or negative) of the propositions composing it. In the traditional logic the names of the moods (invented by Petrus Hispanus) are—First figure, Barbara, Celarent, Daril, Ferió, Baralipton, Celantes, Dabitis, Fápesmó, Frisssömörum; Second figure, Cesare, Camestres, Festino, Barôco: Third figure, Darapti, Félapton, Disamis, Dátisl, Bócardo, Férison. These names are merely mnemonic, and many of their letters are significant. The vowel a denotes a universal affirmative proposition, e the universal negative, i the particular affirmative, and o the particular negative. By the first syllable is indicated the major premise, by the second the minor, and by the third the conclusion. For example, the name Barbara shows that the first mood of the first figure consists of two universal affirmative premises leading to a universal affirmative conclusion. The same understanding is to be had in regard to the vowels of the other words. Certain of the consonants also are significant. Thus, all indirect moods designated by a word beginning with b should be reduced to Barbara, the first mood of the first figure; all that are designated by a word beginning with c to the second mood, Celarent; all in d to Darli, the third; and all in f to Ferio, the fourth. Other letters indicate how to reduce indirect to direct moods: thus signifies that the proposition denoted by the vowel immediately preceding is to be simply converted in the reduction: p, that the proposition denoted by the vowel immediately preceding should be transposed—that is, the major should be made the minor, and conversely: and c, that the mood designated by the word in which it occurs should be reduced per impossibile: whence the verses:

\*\*Simpliciter vult s verti, p vero per acci:

\*\*W vult transponi, c per impossibile duci.

Simpliciter vult s verti, p vero per acci: M vult transponi, c per impossibile duci. Servat majorem, variatque secunda minorem; Tertia majorem variat, servatque minorem.

A moode is a lawful placing of propositions in their dewe qualitie or quantitie. Sir T. Wilson, Art of Logic, fol. 26. 3. In music, same as mode1, 7.

Zend mās, > Pers. māh (> Hind. Turk. māh),
moon, month. The relations of these forms
to each other, and to the words for 'month'
(see month), and their ult. root, are undetermined. The usual explanation is that the
moon is the 'measurer' (sc. of time), ⟨ √ ma,
Skt. mā, measure (whence ult. E. mete¹ and
measure). The L. name of the moon (luna)
and the L., Gr., and Teut. names for the sun
(L. sōl = AS. sōl, etc.; Gr. ηλιος; AS. sunne,
E. sun, etc.) come from other roots, meaning
'shine.'] 1. A heavenly body which revolves
around the earth monthly, accompanying the
earth as a satellite in its annual revolution,
and shining by the sun's reflected light. Next to
the sun, the moon is the most conspicuous and interesting
of celestial objects. The rapidity of its motion, the varicty of its phases, and especially the striking phenomena
of eclipses, compelled the attention of the earliest observers: and the fact that lunar observations can be made
available to determine the longitude has given the theory
of the moon's motion the first rank in economic importance, while the mathematical problems involved have
proved most interesting and fertile from the scientific
point of view. Of all the heavenly bodies (meteors excepted) the moon is nearest to us. Its mean distance
is a little more than sixty times the radius of the earl,
pared with those of the earth sre far greater than those
of any other satellite in proportion to its primary. Its manet, month) mante, mande, G. mond = Icel. mani = Sw. mane = Dan. mane = Goth. mēna

diameter is 2,162 miles (about 0.273 of the earth's equatorial diameter), and its volume, or bulk, is 0.0204, or about one forty-ninth of that of the earth. Its mean density, however (about 3.4 times that of water), is only about three fifths of that of the earth, and its mass about one eightieth. The inclination of its orbit to the ecliptic is 5'8'40'. It completes its revolution around the earth in an average period of 27d. 7h. 43m. 11.5s., which constitutes the sidersal month; the ordinary, or synodical, month, from new moon to new moon again, is a little more than two days longer—29d. 12h. 44m. 2.7s. (See month.) The moon's orbital motion is subject to considerable inequalities, due to the disturbing action of the sun, and the investigation of these inequalities makes up the major part of the "lunar theory." The moon revolves on its axis once in a sidereal month, thus always presenting nearly the same face to the earth—a circumstance which has led to the fallacy of a denial of its rotation. (See rotation.) Its disk appears to the naked eye diversified by dark and bright patches, giving rise to the "man in the moon" of popular fancy (see undermann); but on examination with a powerful telescope these are lost sight of, and replaced by a crowd of interesting objects, such as mountains and valleys, craters and clefts, on a scale unknown upon the earth: the surface-structure seems to be mainly volcanic, resembling very closely in certain respects, and differing most markedly in others from, that which is characteristic of volcanic regions on the earth's surface. The moon has no clouds, shows no indications of an atmosphere or of the presence of water, and is believed to have a temperature which at its maximum does not rise above the melting-point of ice. See libration.

pl. In astron., a method of determining the
longitude of a place by observing with a transit-instrument the times at which the limb of sit-instrument the times at which the limb of the moon and certain stars in the same part of the sky culminate, or cross the meridian. The fundamental principle is essentially the same as that involved in the nautical method of "lunar dis-tances." Among the stars the moon's position is utilized to make known the Greenwich time—but the transit ob-servations are more easy and accurate than those made with a sextant, and the reductions are more simple. The method has been entirely superseded by the telegraphic method wherever circumstances render the latter prac-ticable.

= MHG. muoz = Icel. môt = Goth. \*gamôt (in
deriv. gamôtjan, meet), a meeting (cf. Sw. môte, Dan. mode = E. meet, n.). Hence moot, v., and meet.] 1†. A meeting; a formal assembly. In this sense obsolete, except as used, chiefly in the archaic (Middle English) form mote, in certain historical terms, as folkmoot or folkmote, hallmote, etc. See def. 3.

Alle the men in that mote maden much joye To apere in his presense prestly that tyme. Sir Gawayne and the Green Knight (E. E. T. S.), 1 910. The monke was going to London ward,
There to holde grete mote.

There to holde grete mote.

Lytell Geste of Robyn Hode (Child's Ballads, V. 88).

2. The place of such a meeting.—3. In early Eng. hist., a court formed by assembling the men of the village or tun, the hundred, or the kingdom, or their representatives. It exercised political and administrative functions with some judicial powers. Compare witena-genot. See the quotation.

The four or ten villagers who followed the reeve of each township to the general muster of the hundred were held to represent the whole body of the township from whence they came. Their voice was its voice, their doing its doing, their pledge its pledge. The hundred-moot, a moot which was made by this gathering of the representatives of the townships that lay within its bounds, thus became at once a court of appeal from the moots of each separate village as well as of arbitration in dispute between township and township. The judgment of graver crimes, and of life or death, fell to its share: while it necessarily possessed the same right of law-making for the hundred that the village-moot possessed for each separate village. And as hundred-moot stood above town-moot, so above the hundred-moot stood stood above town-moot, so above the hundred-moot stood the Folk-moot, the general muster of the people in arms, at once war-host and highest law-court, and general Parliament of the tribe. But whether in Folk-moot or hundred-moot, the principle of representation was preserved. In both the constitutional forms, the forms of deliberation and decision, were the same. In each the priests proclaimed silence, the ealdormen of higher blood spoke, groups of freemen from each township stood round, shaking their spears in assent, clashing shields in applause, settling matters in the end by loud shouts of "Aye" or "Nay."

The accumulations of rock and detrital material along the edges of a glacier. In mountains where the glaciers are bordered by cliffs, the materials of which these are composed, being loosened by frost, rain, and gravity, fall upon the ice beneath and are gradually conveyed downward, receiving additions as they move. A simple glacier has ordinarily two such lateral moraines, and when two glaciers meet and unite the two adjacent lateral moraines coalesce and form a medial moraine, and the same thing may be repeated again and again as various lateral glaciers unite themselves with the main ones. At the point where the glaciers end the detritus of the lateral and medial moraines is thrown upon the ground, and forms a more or less irregular pile of debris, called the terminal moraine.

teaches men their duty and the reasons of it.

Paley, Moral Philos., i. 1.

The attempt to exhibit morality as a body of scientific truth fell into discredit, and the disposition to dwell on the emotional side of the moral consciousness became prevalent.

H. Sidgwick, Methods of Ethics, p. 91.

2. The character of being moral; accord with the rules of right conduct; moral quality; virtuousness: often used in a restricted sense to denote sexual purity.

The morality of an action is founded on the freedom of that principle by virtue of which it is in the agent's power, having all things ready and requisite to the performance of an action, either to perform or not perform it. South Sermons

Until we have altered our dictionaries, and have found some other word than morality to stand in popular use for the duties of man to man, let us refuse to accept as moral the contractor who enriches himself by using large machinery to make pasteboard soles pass as leather for the feet of unhappy conscripts.

George Eliot, Theophrastus Such, xvi.

3. Moral conduct; the practice of the duties inculcated by the moral rules that are recognized as valid; in a general and collective sense, those forms of human conduct which are the subject of moral judgments.

Morality [in Shaftesbury's theory] is only Beauty in one of its higher stages.

Fouler, Shaftesbury and Hutcheson, p. 126.

Our theory has been that the development of morality is founded on the action in man of an idea of true or absolute good, consisting in the full realisation of the capabilities of the human soul.

T. H. Green, Prolegomena to Ethics, § 286.

In point of fact, however, morality means nothing more nor less than that state of natural neutrality or indifference to good and evil, to heaven and hell, which distinguishes man from all other existence, and endows him alone with selfhood or freedom.

H. James, Suba, and Shad., p. 4.

Hence—4. The practice of moral duties regarded as apart from and as not based upon vital religious principle.

All others, they (the Jews) thought, served God only with their own Inventions, or placed their Religion in dull mo-rality. Stilling feet, Sermons, I. viii.

John de Vigney wrote a book which he called "The Moralization of Chess," wherein he assures us that this game was invented by a philosopher named Xerxes in the reign of Evil Merodach, king of Babylon, and was made known to that monarch in order to engage his attention and correct his manners. "There are three reasons," says de Vigney, "which induced the philosopher to institute this new pastime: the first, to reclaim a wicked king; the second, to prevent idleness; and the third, practically to demonstrate the nature and necessity of nobleness."

Strutt, Sports and Pastimes, p. 406.

3. The act of rendering moral; subjection to moral rules; the process of giving a moral character to something.

The elimination of ethics, then, as a system of precepta, involves no intrinsic difficulties other than those involved in the admission of a natural science that can account for the moralisation of man.

T. H. Green, Prolegomena to Ethics, § 8.

The highest type of moralisation lies in acquiring such an abstract basis of principle as makes a man a spontaneous and independent fountain of justice and goodness, not a mere channel through which runs a public and common beneficence.

Morin's apparatus. [After the French inventor A. J. Morin (1795–1880).] An apparatus designed to illustrate the laws of falling bodies. It consists of a light wooden cylinder covered with paper, made to rotate uniformly about a vertical axis, in front of which falls a small weight, guided by two light wires. A pencil attached to the falling weight traces out on the paper of the rotating cylinder a line which, so long as the effect of the air-resistance is negligible, is found to be a parabolic curve. The distance fallen through is thus shown to vary according to the square of the time, in accordance with the theoretical law.

# KEY TO PRONUNCIATION.

	as in fat, man, pang.
ā	as in fate, mane, dale.
Ä	as in far, father, guard.
	as in fall, talk, naught.
· 🛦	as in ask, fast, ant.
. &	as in fare, hair, bear.
e	as in met, pen, bless.
· ē	as in mete, meet, meat.
ě	as in her, fern, heard.
	as in ner, tern, near
1	as in pin, it, biscuit.
1	as in pine, fight, file.
0	as in not, on, frog.
ō	as in note, poke, floor.
ö	as in move, spoon, room.
Õ	as in nor, song, off.
u	
ů	as in mute, acute, few (also new,
	tube, duty: see Preface, pp.
	to all and a record pp.
	ix, x).
₽.	as in pull, book, could.

ti German ii, French u.
oi as in oil, joint, boy.
ou as in pound, proud, now.

A single dot under a vowel in an unaccented syllable indicates its abbreviation and lightening, without absolute loss of its distinctive quality. See Preface, p. xi. Thus:

ā as în prelate, courage, captain.
ē as în ablegate, episcopal.
ō as în abrogate, eulogy, democrat.
ū as în singular, education.

A double dot under a vowel in an unac-cented syllable indicates that, even in the mouths of the best speakers, its sound is variable to, and in ordinary utterance ac-tually becomes, the short u-sound (of but, pun, etc.). See Preface, p. xi. Thus:

as in errant, republican.
e as in prudent, difference.
i as in charity, density.
as in valor, actor, idiot.
as in Persia, peninsula.
